- 4..Use Excel.CurrentWorkbook() Function as Source for Query.
- 5..Use Replace feature to extract the SalesRep name from the Excel Table Name.
- 6..Expand column with Excel Tables to Append all Tables into one Table.
- 7..Add correct Data Types for each column
- 8..Introduction to Recursion Problem, where Query will refer to itself and will double the loaded records every time a Refresh is done. And look at details of Loading Data to an Excel Worksheet after using Excel.CurrentWorkbook() Function.
- 9..Solve the Recursion Problem by filtering out the Query/Table Name.
- 10..Add new Excel Table to Workbook and refresh to see that new table is incorporated into Final Data Set.
- 11..Look at M Code for Example #1
- 12..Example2: Append all Excel Tables in Current Workbook To PivotTable Cache & make PivotTable Report. This solves the Recursion Problem because there is not a Query Load table in the Excel Worksheet as an Excel Table.
- 13..Remove Excel Table that is result of Power Query Load to Worksheet by Clearing All. This process will change the Load location to Connection Only.
- 14..Edit Query to Remove unneeded step and to Rename incorrectly named column.
- 15..Look at M Code for Example #2
- 16..Example3: Append all Excel Tables in Current Workbook that has Defined Names.
- 17..Look at different objects in Excel workbook, including Excel Tables and Defined Names.
- 18..Keyboard for Blank Query
- 19..Use Excel.CurrentWorkbook() Function as Source for Query. Then see that this imports Excel Tables and Other Objects.
- 20..Define Table Object: Set of Records for a Set of Columns/Fields.
- 21..Take note that Defined Names are Imported as Tables with generic Columns Names.
- 22..Learn about Table.ColumnNames Power Query Function.
- 23..Filter out Filtered Database Error.
- 24..Create Custom Column and use Table.ColumnNames Power Query Function to Extract Column Names from each Table in each Row.
- 25..Learn about Lookup Operator or Field Access Operator to access the content for each row in a specified column.
- 26..Define List Object: Ordered Sequence of Values.
- 27..Learn about the Positional Index Operator that allows us to access an item in a list. Curly Brackets are the Positional Index Operator; { and } .
- 28..Learn that Power Query uses Base Zero for finding Relative Positions in a List. Zero represents the first position.
- 29..Filter out rows that contain "Column1".
- 30..Remove Custom Column.
- 31..Rename Column
- 32..Use Replace feature to extract the SalesRep name from the Excel Table Name
- 33..Filter Out Query Name / Table Load Name when loading to an Excel Worksheet.
- 34..Expand Columns and Change Data Types
- 35..Closes and Load To Worksheet.
- 36..Add new Excel Table and Refresh.
- 37..Look at M Code for Example #3
- 38..Talk about the non-standard Data Setup we had to deal with.
- 39..Summary
