Tomorrow's World

This title uses the concept of environmental space to resolve many of the issues facing us in the future and applies the lessons specifically to the UK. Believing that we occupy more environmental space than the world can afford, this book seeks to explain what we can do to live comfortably within what we actually have through efficiency and sufficiency. In addition, it aims to present the sustainable levels of consumption for Britain as targets for government, industry and households, as well as an idea of how to achieve them.

Tomorrow's Politics

A groundbreaking exploration of the most promising new ideas for creating the sustainable cities of tomorrow The culmination of a four-year collaborative research project undertaken by leading UK universities, in partnership with city authorities, prominent architecture firms, and major international consultants, Retrofitting Cities for Tomorrow's World explores the theoretical and practical aspects of the transition towards sustainability in the built environment that will occur in the years ahead. The emphasis throughout is on emerging systems innovations and bold new ways of imagining and re-imagining urban retrofitting, set within the context of 'futures-based' thinking. The concept of urban retrofitting has gained prominence within both the research and policy arenas in recent years. While cities are often viewed as a source of environmental stress and resource depletion they are also hubs of learning and innovation offering enormous potential for scaling up technological responses. But city-level action will require a major shift in thinking and a scaling up of positive responses to climate change and the associated threats of environmental and social degradation. Clearly the time has come for a more coordinated, planned, and strategic approach that will allow cities to transition to a sustainable future. This book summarizes many of the best new ideas currently in play on how to achieve those goals. Reviews the most promising ideas for how to approach planning and coordinating a more sustainable urban future by 2050 through retrofitting existing structures Explores how cities need to govern for urban retrofit and how future urban transitions and pathways can be managed, modeled and navigated Offers inter-disciplinary insights from international contributors from both the academic and professional spheres Develops a rigorous conceptual framework for analyzing existing challenges and fostering innovative ways of addressing those challenges Retrofitting Cities for Tomorrow's World is must-reading for academic researchers, including postgraduates insustainability, urban planning, environmental studies, economics, among other fields. It is also an important source of fresh ideas and inspiration for town planners, developers, policy advisors, and consultants working within the field of sustainability, energy, and the urban environment.

Retrofitting Cities for Tomorrow's World

Global environmental change will be with us forever, but how it happens in the future, and with what effect on the planet and its peoples depends to a large extent on how the international agreements,

national politics and local actions play out. This collection provides a comprehensive assessment of these critical interconnections, and reveals how social scientists are making an invaluable contribution to the creation of more science and just livelihoods in a future world.

The Environment of Tomorrow's World

John Thackara has spent a lifetime roving the globe in search of design that serves human needs in a sustainable way. He believes that in our eagerness to find technological solutions to the big challenges faced by the human race, we have all too often ignored the astonishing creativity generated when people work together and in harmony with the world around them.

Negotiating Environmental Change

Mayne provides an integrated analysis of contemporary and future politics and government. He first examines major problems and issues occurring worldwide, surveys different regimes, and assesses the wide variety of active and emerging political movements. Mayne then explores political paradigms and ideologies through a main political spectrum to various alternatives. He outlines some possible elements for a new political paradigm that would be holistic in several different ways. Finally, he outlines scenarios for three possible futures and presents conclusions that indicate what can be done to achieve a political transition to maximize the prospects for a good human future in the 21st century.

How to Thrive in the Next Economy

This work proposes a framework based on the concept of a fair distribution of environmental space to include the diverse needs of North and South. Drawing on research in 38 countries, it aims to give an equitable basis for global development in order to achieve sustainable consumption by the year 2050. The environmental space approach seeks to explain the limitations of the global market economy as a tool of development and to give us the means to alter it in order to achieve a genuine quality of life, rather than simple economic growth. In addition, this book seeks to urge all countries and peoples to consider and evaluate the environmental space approach and to join in a movement towards sustainable production and consumption for the 21st century.

From Politics Past to Politics Future

Updated, completely revised and restructured, this edition includes new material on the environment, European implications, social issues, and the politics and theories behind planning.

Sharing the World

Over 20 years ago Philip Sadler, then head of a leading British business school, wrote *Managerial Leadership in the Post-Industrial Society*. In it he predicted that business would experience the most radical transformation since the Industrial Revolution of the 19th century. This transformation has now taken place. In his latest book, *Sustainable Growth in a Post-Scarcity World*, Sadler charts developments once envisaged by Keynes, Chase, Galbraith and Packard, and more recent radical thinkers such as Chris Anderson. Sadler describes how many goods and services have moved from relative scarcity to relative abundance, and asks how this trend can be reconciled with the global issues of population growth and climate change. He assesses the impact of new technologies, new energy sources, new materials and the development of artificial intelligence, on business, government and economics, and discusses the challenges ahead - the creation of new business models, the need to meet people's legitimate expectations of improved living conditions while avoiding environmental catastrophe, and the need to adapt ideas developed in scarcity to conditions of abundance. Why is it that in countries foremost in creating post-scarcity conditions, millions are still in poverty, and billions, worldwide, still lack basic necessities of life? Philip Sadler agrees with those who say the relief of global poverty cannot rely on aid and corporate philanthropy. He explores the idea of re-engineering products and delivering them into bottom-of-the-pyramid (BOP) markets, and concludes that the more global companies take this route, as some are already doing, the more profitable they will find it, and this will in turn help the poorest people who currently pay more for goods and services - the 'poverty penalty' - than the rich.

Introducing Planning

"Anti-Capitalist Britain is an account of the state of left and radical politics in the UK, delivered through a study of recent anti-capitalist protests and movements. The book is a collaborative project involving writers from various universities in the UK and recent participants in anti-capitalist actions."--BOOK JACKET.

Environment & Planning A.

Provides a comprehensive picture of UK and EC pollution regulation, adopting an interdisciplinary approach to legislation which seeks to move beyond sociological and economic frameworks within which pollution regulation has typically been analyzed in the UK. UK and EC systems are examined to explore how and why regulatory decisions concerning pollution are made at different levels of a federal regulatory hierarchy. Examines essentials of pollution regulation, subsidiarity, and models of decision making, then compares various regulatory techniques in terms of accountability, equality, and effectiveness.
