Cladistics

Systematics underpins all of biology. Cladistics is a method of systematic classification that aims to reconstruct genealogies based on common ancestry, thus revealing the phylogenetic relationships

between taxa. Its applications vary from linguistic analysis to the study of conservation and biodiversity, and it has become a method of choice for comparative studies in all fields of biology. For all students interested in the systematic relationships among organisms, this book provides an integrated, state-of-the-art account of the techniques and methods of modern cladistics, and how to put them into practice.

Transformed Cladistics, Taxonomy and Evolution

This is an examination of the relationship between classification and evolutionary theory, with reference to the competing schools of taxonomic thinking. Emphasis is placed on one of these schools, the transformed cladists who have attempted to reject all evolutionary thinking in classification and to cast doubt on evolution in general. The author examines the limits to this line of thought from a philosophical and methodological perspective. He concludes that transformed cladistics does not achieve what it claims and that it either implicitly assumes a Platonic World View, or is unintelligible without taking into account evolutionary processes--the very processes it claims to reject. Through this analysis the author attempts to formulate criteria of an objective and consistent nature that can be used to judge competing methodologies and theories. Philosophers of science, zoologists interested in taxonomy, and evolutionary biologists will find this a compelling study.

Biodiversity Conservation and Phylogenetic Systematics

This book is about phylogenetic diversity as an approach to reduce biodiversity losses in this period of mass extinction. Chapters in the first section deal with questions such as the way we value phylogenetic diversity among other criteria for biodiversity conservation; the choice of measures; the loss of phylogenetic diversity with extinction; the importance of organisms that are deeply branched in the tree of life, and the role of relict species. The second section is composed by contributions exploring methodological aspects, such as how to deal with abundance, sampling effort, or conflicting trees in analysis of phylogenetic diversity. The last section is devoted to applications, showing how phylogenetic diversity can be integrated in systematic conservation planning, in EDGE and HEDGE evaluations. This wide coverage makes the book a reference for academics, policy makers and stakeholders dealing with biodiversity conservation.

Mapping Our Ancestors

Much of what we are comes from our ancestors. Through cultural and biological inheritance mechanisms, our genetic composition, instructions for constructing artifacts, the structure and content of languages, and rules for behavior are passed from parents to children and from individual to individual. Mapping Our Ancestors demonstrates how various genealogical or "phylogenetic" methods can be used both to answer questions about human history and to build evolutionary explanations for the shape of history. Anthropologists are increasingly turning to quantitative phylogenetic methods. These methods depend on the transmission of information regardless of mode and as such are applicable to many anthropological questions. In this way, phylogenetic approaches have the potential for building bridges among the various subdisciplines of anthropology; an exciting prospect indeed. The structure of Mapping Our Ancestors reflects the editors' goal of developing a common understanding of the methods and conditions under which ancestral relations can be derived in a range of data classes of interest to anthropologists. Specifically, this volume explores the degree to which patterns of ancestry can be determined from artifactual, genetic, linguistic, and behavioral data and how processes such as selection, transmission, and geography impact the results of phylogenetic analyses. Mapping Our Ancestors provides a solid demonstration of the potential of phylogenetic methods for studying the evolutionary history of human populations using a variety of data sources and thus helps explain how cultural material, language, and biology came to be as they are.

Mission statement - coresci.org Series Editor: Todd Charles Wood Core Academy of Science encourages young Christian scholars to explore the hardest problems in creation. Engineers sometimes classify problems as easy, hard, and impossible. Easy problems are trivial because they can be solved merely by applying known principles. Impossible problems cannot be solved no matter how hard we try. Hard problems are the problems in between that require the most work but yield the greatest rewards. Sometimes hard problems are accumulations of many easy problems, and sometimes they turn out to be impossible. When a hard problem is solved, though, it is widely celebrated. For Christians and especially young-age creationists, understanding creation has many "hard problems." Evidences of the great age of the universe and earth can be difficult to explain. Likewise with evidences of evolution. Creationists reject the conventional explanations that involve millions of years and humans evolving from animals, but alternative explanations that satisfy our scientific curiosity and our desire to remain true to the revealed Word of God are much rarer and not widely accepted. It is much easier to focus on the detection of error rather than the more difficult discovery of truth. This focus on error rather than truth pervades evangelical Christianity, because it's relatively easy. We all like the easy and impossible. We teach our children to recite verses from the Bible and answers to our catechisms, but when they ask difficult questions, we say, "Only God knows." We might even scold them for being impertinent or irreverent. Core Academy equips the next generation to tackle these great mysteries by first and most importantly helping young scholars to develop a bold, confident faith. All too often, scholars who face challenging puzzles become disillusioned and stray from the faith. Our first goal, then, must be enriching and nurturing strong faith in Jesus Christ as Savior and Creator.

The American Biology Teacher

This new edition of a foundational text presents a contemporary review of cladistics, as applied to biological classification. It provides a comprehensive account of the past fifty years of discussion on the relationship between classification, phylogeny and evolution. It covers cladistics in the era of molecular data, detailing new advances and ideas that have emerged over the last twenty-five years. Written in an accessible style by internationally renowned authors in the field, readers are straightforwardly guided through fundamental principles and terminology. Simple worked examples and easy-to-understand diagrams also help readers navigate complex problems that have perplexed scientists for centuries. This practical guide is an essential addition for advanced undergraduates, postgraduates and researchers in taxonomy, systematics, comparative biology, evolutionary biology and molecular biology.

Can we use the patterns and processes of convergent evolution to make inferences about universal laws of life, on Earth and elsewhere? In this book, Russell Powell investigates whether we can use the patterns and processes of convergent evolution to make inferences about universal laws of life, on Earth and elsewhere. Weaving together disparate philosophical and empirical threads, Powell offers the first detailed analysis of the interplay between contingency and convergence in macroevolution, as it relates to both complex life in general and cognitively complex life in particular. If the evolution of mind is not a historical accident, the product of convergence rather than contingency, then, Powell asks, is mind likely to be an evolutionarily important feature of any living world? Stephen Jay Gould argued for the primacy of contingency in evolution. Gould's "radical contingency thesis" (RCT) has been challenged,

but critics have largely failed to engage with its core claims and theoretical commitments. Powell fills this gap. He first examines convergent regularities at both temporal and phylogenetic depths, finding evidence that both vindicates and rebuffs Gould's argument for contingency. Powell follows this partial defense of the RCT with a substantive critique. Among the evolutionary outcomes that might defy the RCT, he argues, cognition is particularly important—not only for human-specific issues of the evolution of intelligence and consciousness but also for the large-scale ecological organization of macroscopic living worlds. Turning his attention to complex cognitive life, Powell considers what patterns of cognitive convergence tell us about the nature of mind, its evolution, and its place in the universe. If complex bodies are common in the universe, might complex minds be common as well?

The Blackwell Companion to Hermeneutics

In this book, fifteen authors from a wide spectrum of disciplines (ranging from the natural sciences to the arts) offer assessments of the way time enters their work, the definition and uses of time that have proved most productive or problematic, and the lessons their subjects can offer for our understanding of time beyond the classroom and laboratory walls. The authors have tried, without sacrificing analytical rigour, to make their contribution accessible to a cross-disciplinary readership. Each chapter reviews time's past and present application in its respective field, considers the practical and logical problems that remain, and assesses the methods researchers are using to escape or resolve them. Particular attention is paid to ways in which the technical treatment of time, for problem-solving and model-building around specific phenomena, call on - or clash with - our intuitive perceptions of what time is and does. The spans of time considered range from the fractions of seconds it takes unstable particles to disintegrate to the millions of years required for one species to give way to another. Like all central conceptual words, time is understood on several levels. By inviting input from a broad range of disciplines, the book aims to provide a fuller understanding of those levels, and of the common ground that lurks at their base. Much agreement emerges - not only on the nature of the problems time presents to modern intellectual thought, but also on the clues that recent discoveries may offer towards possible solutions.

Time in Contemporary Intellectual Thought

"Legend is overdue for replacement, and an adequate replacement must attend to the process of science as carefully as Hull has done. I share his vision of a serious account of the social and intellectual dynamics of science that will avoid both the rosy blur of Legend and the facile charms of relativism. . . . Because of [Hull's] deep concern with the ways in which research is actually done, Science as a Process begins an important project in the study of science. It is one of a distinguished series of books, which Hull himself edits."—Philip Kitcher, *Nature* "In *Science as a Process*, [David Hull] argues that the tension between cooperation and competition is exactly what makes science so successful. . . . Hull takes an unusual approach to his subject. He applies the rules of evolution in nature to the evolution of science, arguing that the same kinds of forces responsible for shaping the rise and demise of species also act on the development of scientific ideas."—Natalie Angier, *New York Times Book Review* "By far the most professional and thorough case in favour of an evolutionary philosophy of science ever to have been made. It contains excellent short histories of evolutionary biology and of systematics (the science of classifying living things); an important and original account of modern systematic controversy; a counter-attack against the philosophical critics of evolutionary philosophy; social-psychological evidence, collected by Hull himself, to show that science does have the character

demanding by his philosophy; and a philosophical analysis of evolution which is general enough to apply to both biological and historical change."—Mark Ridley, *Times Literary Supplement* "Hull is primarily interested in how social interactions within the scientific community can help or hinder the process by which new theories and techniques get accepted. . . . The claim that science is a process for selecting out the best new ideas is not a new one, but Hull tells us exactly how scientists go about it, and he is prepared to accept that at least to some extent, the social activities of the scientists promoting a new idea can affect its chances of being accepted."—Peter J. Bowler, *Archives of Natural History* "I have been doing philosophy of science now for twenty-five years, and whilst I would never have claimed that I knew everything, I felt that I had a really good handle on the nature of science, Again and again, Hull was able to show me just how incomplete my understanding was. . . . Moreover, [Science as a Process] is one of the most compulsively readable books that I have ever encountered."—Michael Ruse, *Biology and Philosophy*

Science as a Process

This book documents Willi Hennig's founding of phylogenetic systematics and the relevancy of his work for the future of cladistics.

The Future of Phylogenetic Systematics

This series aims to publish innovative works in the field of zoo and aquarium biology and conservation, with priority given to books that focus on the interface between captive and field conservation and seek to merge theory with practice. This volume summarizes the large body of research on grasses of the last quarter century and encompasses a wide range of topics, from morphology to DNA.

Grass Systematics and Evolution

This text brings together fundamental information on insect taxa, morphology, ecology, behavior, physiology, and genetics. Close relatives of insects, such as spiders and mites, are included.

Vertebrate palaeontology is a lively field, with new discoveries reported every week... and not only dinosaurs! This new edition reflects the international scope of vertebrate palaeontology, with a special focus on exciting new finds from China. A key aim is to explain the science. Gone are the days of guesswork. Young researchers use impressive new numerical and imaging methods to explore the tree of life, macroevolution, global change, and functional morphology. The fourth edition is completely revised. The cladistic framework is strengthened, and new functional and developmental spreads are added. Study aids include: key questions, research to be done, and recommendations of further reading and web sites. The book is designed for palaeontology courses in biology and geology departments. It is also aimed at enthusiasts who want to experience the flavour of how the research is done. The book is strongly phylogenetic, and this makes it a source of current data on vertebrate evolution.

Brace has reworked ten of the many articles he has published on human evolution over the past 40 years and assembled them into a statement on evolutionary anthropology. He begins by investigating which anthropological data can benefit from an evolutionary perspective and which cannot. Then he explores such topics as Darwinism, race, cladistics, phylogeny, Neanderthals, dentition, and cultural ecology. Annotation copyrighted by Book News, Inc., Portland, OR

Problematic fossils--those groups of organisms that do not fit conveniently into any existing phylum--play a pivotal role in the reconstruction of the history of life, being in effect "early experiments." This lavishly illustrated volume provides careful analyses and descriptions--in anatomical, functional, and developmental terms--of most of the major problematic fossil taxa. Sixteen original papers, written by internationally recognized scholars, discuss the features that make these taxa problematic and that provide clues to their phylogenetic relationships. Since Precambrian groups have been well covered in the existing literature, Hoffman and Nitecki focus on Paleozoic, and especially Early Paleozoic organisms, although Precambrian biota are also discussed.

This General Zoology Laboratory Manual is intended for students taking their first course in zoology. Provided are exercises and experiences that will help students: (1) understand the general principles that unite animal biology, (2) appreciate the diversity found in the animal kingdom and understand the evolutionary relationships that explain this diversity, (3) become familiar with the structure and function of vertebrate organ systems and appreciate some of the evolutionary changes that took place in the development of those organ systems, and (4) develop problem-solving skills.

Proceedings of the ... Annual Meeting of the Pacific Division, American Association for the Advancement of Science

This open access book features essays written by philosophers, biologists, ecologists and conservation scientists facing the current biodiversity crisis. Despite increasing communication, accelerating policy and management responses, and notwithstanding improving ecosystem assessment and endangered species knowledge, conserving biodiversity continues to be more a concern than an accomplished task. Why is it so? The overexploitation of natural resources by our species is a frequently recognised factor, while the short-term economic interests of governments and stakeholders typically clash with the burdens that implementing conservation actions imply. But this is not the whole story. This book develops a different perspective on the problem by exploring the conceptual challenges and practical defiance posed by conserving biodiversity, namely: on the one hand, the difficulties in defining what biodiversity is and characterizing that "thing" to which the word 'biodiversity' refers to; on the other hand, the reasons why assessing biodiversity and putting in place effective conservation actions is arduous.

Entomologica Scandinavica

Biologists searching for a resource that explores all of the exciting changes that have occurred recently in the field will turn to this eighth edition. It offers insight into the multidisciplinary nature of the field, presenting a sound historical base, up-to-date coverage, and a look at the latest controversies. The authors evaluate conflicting theories and provide a reasoned judgment as to which is preferable. In a new chapter the authors examine marine biogeography, so that biologists can compare and analyze the data, patterns and problems arising from continental, marine and island biogeography.

Problematic Fossil Taxa

Draws on contributions from leading researchers to deliver a comprehensive overview of the latest knowledge on coral reef fishes.

Heredity

This volume offers a new and comprehensive exploration of the theory and practice of editing early modern women's writing.

General Zoology

The complete guide to practical work in the biological sciences: from conception of the investigation, through data collection, data analysis and finally presentation.

From Assessing to Conserving Biodiversity

Dispersals and diversification offers linguistic and archaeological perspectives on the disintegration of Proto-Indo-European, the ancestor of the Indo-European language family. Two chapters discuss the early phases of the disintegration of Proto-Indo-European from an archaeological perspective,

integrating and interpreting the new evidence from ancient DNA. Six chapters analyse the intricate relationship between the Anatolian branch of Indo-European, probably the first one to separate, and the remaining branches. Three chapters are concerned with the most important unsolved problems of Indo-European subgrouping, namely the status of the postulated Italo-Celtic and Graeco-Armenian subgroups. Two chapters discuss methodological problems with linguistic subgrouping and with the attempt to correlate linguistics and archaeology. Contributors are David W. Anthony, Rasmus Bjørn, José L. García Ramón, Riccardo Ginevra, Adam Hyllested, James A. Johnson, Kristian Kristiansen, H. Journal of Vertebrate Paleontology

In this deep examination of functional morphology, a renowned paleoanthropologist offers a new way to investigate human evolution through the fossil record. It is common for two functional anatomists to examine the exact same fossil material, yet argue over its evolutionary significance. How can this be? Traditionally, paleoanthropology has interpreted hominin fossil morphology by first considering the ecological challenges hominins faced, then drawing adaptive inferences based on the idea that skeletal morphology is largely a reflection of paleoecology. In *Functional Inference in Paleoanthropology*, innovative paleoanthropologist David J. Daegling suggests that researchers can resolve dichotomous interpretations of the fossil record by instead focusing on the biology and development of the bones themselves—such as measurable responses to deformations, stresses, and damage. Critically exploring how scientists probe and interpret fossil morphology for behavioral and adaptive inferences, Daegling makes the case that an intelligible science of functional morphology in the fossil record is impossible without the inclusion of this mechanobiological perspective. Drawing on historical examples from long-standing debates on the emergence of bipedality and the dietary shifts that facilitated the emergence of the hominin clade, Daegling traces the disjunctions between theoretical principles of comparative morphology and methodological practice in the paleontological context of human evolution. Sharing rich findings from recent decades of research in skeletal biomechanics, *Functional Inference in Paleoanthropology* examines how bone adapts over the lifespan, what environmental factors influence its quality, and how developmental constraints limit the skeleton's adaptive potential over evolutionary time.

It illustrates practices and methods specific to each major chemical analytical technique while showcasing innovations and trends currently impacting the field. Many of the

Albanian Literature

The tender plant of Albanian literature grew in a rocky soil. It was late to evolve and its development, indeed its very existence, was threatened in many periods. "Albanian Literature: A Short History" tells the story of the survival and growth of Albanian creative writing beginning with the earliest thirteenth century texts of Theodor of Shkodra, tracing the development of the modern literature of Buzuku, Budi and Bogdani, the incorporation of the Muslim influences of Frakulla and Kycyku and continuing with the works of Cajupi and Kadare during the reign of King Zog and the Hoxha administration. A unique book that illuminates an under-researched subject, "Albanian Literature" is an essential reference guide for all those interested in Balkan cultures, in comparative literature and in European cultural history in general.

Writing Up Research

This text is for students who are entering graduate-level studies in their academic fields and/or who need to write research results in the form of technical papers, journal articles, theses, or dissertations.

Corporate Governance and Ethics

This book is the first to present a comprehensive framework of the theory and practice of corporate governance and business ethics by focusing on the four cornerstones promoted by the AACSB. Readers will quickly gain an understanding of the main themes, perspectives, frameworks, concepts, and issues pertaining to corporate governance and business ethics from historical, global, institutional, commercial, best practices, and regulatory perspectives. Additionally, there is also complete coverage of all oversight functions of corporate governance.

Electronics

"Electronics: Principles and Applications" introduces principles and applications of analog devices, circuits and systems. Like earlier editions, the Sixth Edition combines theory with real world applications in a well-paced sequence that introduces students to such topics as semiconductors, op amps, linear integrated circuits, and switching power supplies. Its purpose is to prepare students to effectively diagnose, repair, verify, and install electronic circuits and systems. Prerequisites are a command of algebra and an understanding of fundamental electrical concepts.

40 vjet të Akademisë së Shkencave dhe të Arteve të Kosovës

An examination of key issues in electric utilities restructuring. It covers: electric utility markets in and out of the USA; the Open Access Same-time Information System; tagging transactions; trading energy; hedging tools for managing risks in various markets; pricing volatility, risk and forecasting; regional

transmission organization; and more. The text contains acronyms, a contract specifications sample, examples, and nearly 500 bibliographic citations, tables, and drawings.

Restructured Electrical Power Systems

In just the last few years, the increase in worldwide photovoltaic (PV) shipments has grown from 15 to 25 percent per year. Grid-connected applications have surpassed stand-alone applications, system components have realized significant improvements, and major efforts are underway to build a quality control infrastructure for PV systems. Such rapid growth and evolution continues to put engineers skilled in PV systems at a premium. Thoroughly updated, *Photovoltaic Systems Engineering, Second Edition* offers a practical engineering basis for PV system design. It provides quick exposure to all system building blocks, then examines both the whys and hows of the electrical, mechanical, economic, and aesthetic aspects of PV system design—why certain designs are done in certain ways and how the design process is implemented. Students mastering the contents of this book will have the engineering judgement needed to make intelligent decisions based on a clear understanding of the parameters involved in PV systems. Highlights of the Second Edition:

- Y Complete updates to each chapter that incorporate currently available system components and recent changes in codes and standards
- Y Increased emphasis on design trade-offs and the design of grid-connected systems
- Y New discussions on site evaluation, and battery connections
- Y A new section on array mounting system design
- Y A new section on utility interactive residential PV systems
- Y A new section on curve fitting using Excel
- Y A new appendix that presents a recommended format for submitting PV design packages for permitting or design review purposes
- Y Examples and exercises replaced or modified to incorporate contemporary components, such as the Linear Current Booster

Photovoltaic Systems Engineering, Second Edition

Many universities now offer a course in biomedical optics, but lack a textbook specifically addressing the topic. Intended to fill this gap, *An Introduction to Biomedical Optics* is the first comprehensive, introductory text describing both diagnostic and therapeutic optical methods in medicine. It provides the fundamental background needed for graduate students in biomedical and electrical engineering, physics, biology, and medicine to learn about several biomedical optics issues. The textbook is divided into three main sections: general optics theory, therapeutic applications of light, and diagnostic optical methods. Each chapter has different levels of detail to build students' knowledge from one level to the next. The first section covers the history of optics theory and the basic science behind light-tissue interactions. It also introduces the relevant approaches and approximations used to describe light propagation in turbid biological media. In the second section, the authors look more closely at light-tissue interactions and their applications in different medical areas, such as wound healing and tissue welding. The final section examines the various diagnostic methods that are employed using optical techniques. Throughout the text, the authors employ numerical examples of clinical and research requirements. Fulfilling the need for a concise biomedical optics textbook, *An Introduction to Biomedical Optics* addresses the theory and applications of this growing field.

An Introduction to Biomedical Optics

This book provides an accessible text and critical analysis of the concepts and delivery of community justice, a focal point in contemporary criminal justice. The probation service in particular has undergone radical changes in relation to professional training, roles and delivery of services, but now operates within a mosaic of a number of inter-agency initiatives. This book aims to provide a critical appreciation of community justice, its origin and direction, and to engage with debates on the ways in which the trend towards community justice is changing the criminal justice system. At the same time it examines the inter-agency character of intervention and the developing idea of end-to-end offender management, and familiarises the reader with a number of more specialist areas, such as hate crime, mental illness, substance abuse, and victims.

Community Justice

Describes control systems for boilers and heat-recovery steam generators (HRSGs) in a variety of applications, from waste-to-energy plants to combined-cycle gas-turbine power stations. Basics such as methods of connecting instruments are explained, and more advanced discussions of design features of distributed control systems are also included. At every stage, emphasis is given to the interactive nature of plants and to troubleshooting and problem solving. Includes chapter summaries.

For this revision of their bestselling junior- and senior-level text, Guru & Hiziroglu have incorporated eleven years of cutting-edge developments in the field since *Electric Machinery & Transformers* was first published. Completely re-written, the new Second Edition also incorporates suggestions from students and instructors who have used the First Edition, making it the best text available for junior- and senior-level courses in electric machines. The new edition features a wealth of new and improved problems and examples, designed to complement the authors' overall goal of encouraging intuitive reasoning rather than rote memorization of material. Chapter 3, which presents the conversion of energy, now includes: analysis of magnetically coupled coils, induced emf in a coil rotating in a uniform magnetic field, induced emf in a coil rotating in a time-varying magnetic field, and the concept of the revolving field. All problems and examples have been rigorously tested using Mathcad.

Anne of Geierstein, Or, the Maiden of the Mist

There is hardly any book that aims at solving problems typically encountered in the laser field, and this book intends to fill the void. Following some initial exercises related to general aspects in laser physics (Chapt. 1), the subsequent problems are organized along the following topics: (i) Interaction of radiation with matter either made of atoms or ions, weakly interacting with surrounding species, or made of more complicated elements such as molecules or semiconductors (Chapters 2 and 3). (ii) Wave propagation in optical media and optical resonators (Chapters 4 and 5). (iii) Optical and electrical pumping processes and systems (Chapter 6): (iv) Continuous wave and transient laser behaviors (Chapters 7 and 8). (v) Solid-state, dye, semiconductor, gas and X-ray lasers (Chapters 9 and 10). (vi) Properties of the output beam and beam transformation by amplification, frequency conversion and pulse compression or expansion (Chapters 11 and 12). Problems are proposed here and solved following the contents of Orazio Svelto's Principles of Lasers (fourth edition; Plenum Press, New York, 1998). Whenever needed, equations and figures of the book mentioned above are currently used with an appropriate reference [e. g. , Eq. (1. LI) of the book is referred to as Eq. (LI. 1) of PL]. One can observe, however, that the types of problems proposed and discussed are of general validity and many of these problems have actually been suggested by our own long-time experience in performing theoretical and experimental researches in the field.
