In early April 1911 Albert Einstein arrived in Prague to become full professor of theoretical physics at the German part of Charles University. It was there, for the first time, that he concentrated primarily on the problem of gravitation. Before he left Prague in July 1912 he had submitted the paper "Relativität und Gravitation: Erwiderung auf eine Bemerkung von M. Abraham" in which he remarkably anticipated what a future theory of gravity should look like. At the occasion of the Einstein-in-Prague centenary an international meeting was organized under a title inspired by Einstein's last paper from the Prague period: "Relativity and Gravitation, 100 Years after Einstein in Prague". The main topics of the conference included: classical relativity, numerical relativity, relativistic astrophysics and cosmology, quantum gravity, experimental aspects of gravitation and conceptual and historical issues. The conference attracted over 200 scientists from 31 countries, among them a number of leading experts in the field of general relativity and its applications. This volume includes abstracts of the plenary talks and full texts of contributed talks and articles based on the posters presented at the conference. These describe primarily original results of the authors. Full texts of the plenary talks are included in the volume "General Relativity, Cosmology and Astrophysics--Perspectives 100 Years after Einstein in Prague".

The essays in this volume address questions about responsibility that arise in moral philosophy and legal theory. Some analyze different theories of causality and human agency, scouting for satisfactory resolutions to the controversies of free will and determinism, while some look at the problem of responsibility in the legal realm. Others explore libertarian views about political freedom and accountability, while still others examine the notion of partial or divided responsibility, or the relationship between responsibility and the emotions.

Mathematics at Work

This human dimensions assessment quantified the impact of changes in the work environment of soldiers and leaders who participated in the brigade level task force (TF XXI) Advanced Warfighter Experiment (AWE). The TF XXI AWE investigated the potential for digitizing land combat forces through the fielding of new technology equipment and accompanying changes in organizational design, tactics, techniques and procedures. Surveys and structured interviews were used to assess soldier and leader perceptions of TF XXI, the work environment, and organizational outcomes. The major finding is that as soldiers and leaders became more familiar with the new technology and its use, they were less threatened by it, and appreciated more the positive impact it would have on them, their units, and the Army as a whole. The findings also underscore potential problems with a number of different but clearly interrelated human dimensions. One example is the new career opportunities created by this technology within but also outside the Army, and the possible impact of these opportunities on Army wide personnel retention and recruitment programs. This study contributes to the requirement to define, quantify, and record empirical information to more fully understand and respond to the human dimensions of the Force XXI program.

Responsibility: Volume 16, Part 2

Scanlon reframes current philosophical debates as he explores the moral permissibility of an action. Blame, he argues, is a response to the meaning of an action rather than its permissibility. This analysis leads to a novel account of the conditions of moral responsibility and to important conclusions about the ethics of blame.

Human Dimensions Assessment of the Task Force XXI Advanced Warfighter Experiment

This book is one of the finest I have ever read. To write a foreword for it is an honor, difficult to accept. Everyone knows that architects and master masons, long before there were mathematical theories, erected structures of astonishing originality, strength, and beauty. Many of these still stand. Were it not for our now acid atmosphere, we could expect them to stand for centuries more. We admire early architects' visible success in the distribution and balance of thrusts, and we presume that master masons had rules, perhaps held secret, that enabled them to turn architects' bold designs into reality. Everyone knows that rational theories of strength and elasticity, created centuries later, were influenced by the wondrous buildings that men of the sixteenth, seventeenth, and eighteenth centuries saw daily. Theorists know that when, at last, theories began to appear, architects distrusted them, partly because they often disregarded details of importance in actual construction, partly because nobody but a mathematician could understand the aim and function of a mathematical theory designed to represent an aspect of nature. This book is the first to show how statics, strength of materials, and elasticity grew alongside existing architecture with its millennial traditions, its host of successes, its ever-renewing styles, and its numerous problems of maintenance and repair. In connection with studies toward repair of the dome of St. Peter's by Poleni in 1743, on p.

Physics Mechanics 50,000 MCQ Vol.01 : Solved Papers

This text provides an understanding of the foundations and structure of physical science by emphasizing science as a search for truth rather than an accumulation of facts. It develops the subject through concrete examples such as inclined planes and levers, speeds and displacements, progressing to consideration of forces and the concept of inertia, and the idea of energy. Similarly, a study of observable chemical reactions advances to the ways in which atoms combine, separate and displace one another, and how observable masses of reactants and products illustrate how the atoms are combining. The fundamental ideas are applied to astronomy, optics, geology, music and the chemical compounds of life processes. The wide variety of end- of-chapter problems and multiple choice questions reinforce comprehension of each topic.

New Dimensions in Higher Education

This book explores different dimensions of the field of corporate governance and social responsibility. It discusses how business and society perceive and relate to CSR; how the field has continued to reshape modern corporate boardrooms in both the advanced and emerging economies; how CSR has transformed the manner in which modern corporate entities disclose the non-financial information aspect of their operations to the world at large; and the way in which sustainable development has continued to contribute to improving the quintuple bottom line - people, planet, prosperity, partnership and peace - of 21st century corporate entities. Further, the book also provides evidence of how these aspects of corporate social responsibility are depicted in different forms in eleven nations around the globe.

Engineering System Dynamics

Designed for use in a standard two-semester engineering thermodynamics course sequence. The first half of the text contains material suitable for a basic Thermodynamics course taken by engineers from all majors. The second half of the text is suitable for an Applied Thermodynamics course in mechanical engineering programs. A First Course in Physical Science

This book explores precisely how mathematics allows us to model and predict the behaviour of physical systems, to an amazing degree of accuracy. One of the oldest explanations for this is that, in some profound way, the structure of the world is mathematical. The ancient Pythagoreans stated that "everything is number". However, while exploring the Pythagorean method, this book chooses to add a second principle of the universe: the mind. This work defends the proposition that mind and mathematical structure are the grounds of reality.
