The amygdala is an almond-shaped collection of nuclei found in the temporal lobe that seems to be especially involved with fearful and anxious emotions.

The hippocampus is next to and interconnected with the amygdala.

The parahippocampal gyrus is an area of cortex that surrounds the hippocampus and also plays a role in memory.

The cingulate cortex or cingulate gyrus is found just above the corpus callosum and is involved in various aspects of emotion and memory.

The hypothalamus controls hormone release via the anterior pituitary and can exert widespread influence over bodily states to maintain homeostasis.
