Goodman & Gilman's the Pharmacological Basis of Therapeutics

Goodman & Gilman is the Bible of pharmacology as it has been since the first edition written by Louis Goodman and Alfred Gilman and published in 1941. It is the definitive textbook for all medical and pharmacy students and is a must have purchase for residents in internal medicine and pharmacologists. The book is a higher level than our Katzung and should be considered as the perfect accompaniment to the new Harrison. The objective of this textbook/ reference work is to provide a comprehensive and up-to-date correlation of pharmacology with related medical sciences, a reinterpretation of the actions and uses of drug from the view point of the latest advances in medicine and place emphasis on the application of pharmacodynamics to therapeutics. Throughout its history, Goodman & Gilman has become more than a textbook. It is a working template for effective and rational prescribing of drugs in daily practice. The careful balance of basic science and clinical application has guided students and practitioners to a better understanding of how and why drugs work. The information is presented in a style that reads with maximum clarity and purpose. Transformed and expanded in the last ed

Goodman and Gilman's the Pharmacological Basis of Therapeutics

Written by two experienced toxicology lecturers, Principles of Toxicology provides a broad-based yet in-depth introduction to this diverse subject. Comprehensive and easy-to-read, the book covers this broad and interdisciplinary field from the viewpoint of three different functional levels: molecular and cellular; physiological; and ecological and environmental. This revised second edition expands the coverage of the book while keeping the organizational format that made the first edition a bestseller. It also includes a series of brief case studies illustrating the application of toxicological principles to current issues of interest. Each and every chapter has been revised, several have been significantly rewritten, and three are entirely new. This new edition retains the extensive cross-referencing system that links all sections and enhances the integration of material. It also includes an appendix of selected toxicants that describes chemical structure and category of use. These features combine to make finding specific information quick and easy. The highly readable format and uniform, consistent presentation of information will make this the most used reference on your shelf. See what's new in the second edition:

Goodman and Gilman's the Pharmacological Basis of Therapeutics

Part 3 of the Handbook of Experimental Pharmacology (Concepts in Biochemical Pharmacology) applies the principles enunciated in Parts 1 and 2 to clinical pharmacology and toxicology. The major objective is to elucidate the many factors that determine the relationships between pharmacokinetic aspects of the disposition and metabolism of drugs and their therapeutic or toxic actions in man. Because of the more restricted information obtainable in human studies, this volume reflects the editors' bias that an understanding of pharmacokinetics is fundamental for assessing pharmacologic or toxicologic effects of drugs in humans. The first chapter is a unique primer on when to apply and how to use pharmacokinetic tools in human pharmacology. The second chapter explains the general assumptions underlying pharmacokinetic approaches both in simple terms for the novice and in mathematical form for the more sophisticated reader. Several chapters on determinants of drug concentration and activity discuss drug absorption, drug latentiation, drugs acting through metabolites, entero hepatic drug circulation, influence of route of drug administration on response, genetic variations in drug disposition and response, age differences in absorption, distribution and excretion of drugs, and pathologic and physiologic factors affecting absorption, distribution and excretion of drugs and drug response. The focus of these chapters is data obtained in human, rather than animal, studies. Most of the chapters contain new material never summarized previously.

Stick Control

clinical efficacy of haemostatic agents had to be published work and had to fulfil most of the following minimum requirements: (1) Quantitation of the measured blood loss was required, and not merely a clinical impression of the amount of blood lost, if the document pertained to a planned but «open» clinical trial. (2) Only double-blind trials with random allocation of the placebo and experimental drug to preselected patients were considered suitable for discussion, if the blood loss had not been quantitated in a prospective trial. (3) Definition and appropriate selection of patients admitted to the trial: all inclusion and exclusion criteria used to select patients had to be mentioned in detail. (4) Once included in the trial, patients could be withdrawn only on the basis of strict criteria for withdrawal which had been defined in advance. (5) A double-blind trial had to be continued for an adequate length of time if the haemostatic agent was being assessed in the prevention of bleeding in patients with a long lasting bleeding disorder. (6) A clear and detailed statistical analysis of the results was required. Moreover, a clear distinction between the therapeutic and prophylactic value of the haemostatic agent had to be made and applied separately to the group of patients without any major basic disorder and those with a bleeding disorder e.g. : chronic thrombocytopenia, haemophilia, Rendu-Osler telangiectasia ... General statements not substantiated by experimental data, even when issued by well-known authorities, were not considered a reasonable basis for discussion.
