A flame test is a qualitative test that can be used to identify metal ions in solution.

When the sample containing the metal ions is heated in the flame the electrons absorb energy and transition to higher energy levels (excited state).

The electrons don't stay in the excited state forever - the electrons emit energy and transition back to the lower energy levels.

The exact wavelengths of light emitted depend on the energy difference between the energy levels.

observe the color of the flame

light the sternal burner

notice and look for any distinct changes in flame

aim for the hottest part of the flame

the flame test result for lithium

looking for a bright yellow flame

observe a distinctive color for calcium chloride

allow our sternal burner to completely cool
