HOW TO CREATE A DATA ANALYSIS PLAN FOR A PROPOSAL AND DISSERTATION CHAPTER 3

Descriptive statistics were then used to evaluate whether the study's main variables were normally distributed. Variables with a skew of less than two were considered sufficiently normal (Steinberg, 2011) and suitable for inferential statistics. If any of the main variables were not normally distributed, the data analysis plan would be updated.

Since RQ 4 examined regions, analysis of variance (ANOVA) was used to compare differences in cultural orientation, leadership, and creativity. In alignment with Hofstede's (2008) recommendation, the study goal was to include at least 20 participants to represent each of the seven regions in Turkey. The mean scores of each variable in each region were compared to determine if there were statistically significant differences.

Dr. Joseph Hage 2013 INFLUENCE OF RELIGION AND RELIGIOSITY ON LEADERSHIP PRACTICES IN THE WORKPLACE: A QUANTITATIVE CORRELATION STUDY

The data collected through the surveys were loaded into the Microsoft Excel and the IBM SPSS software tools for statistical analysis. Initially, statistics were calculated on the demographic data variables to describe the sample characteristics.

Significance tests consist of two categories: (a) parametric tests, which are primarily derived from ratio and interval data; and (b) nonparametric tests, used with ordinal and nominal measurements (Aron et al., 2011).

The mean and standard deviation were calculated to determine how tightly distributed the sample was around the mean to confirm the differences in the leadership practices of organizational leaders based on their religion (Cooper & Schindler, 2011). Multiple regression tests were used to determine if the leadership practices could be predicted based on an organizational leader's religion, religiosity, and other factors.

Creswell (2007) reported that qualitative data analysis consists of describing the captured information and determining themes. The goal of data analysis is to involve appropriate interpretation and distillation of the data to determine themes.

Theme identification's constant analysis enabled the research to contribute to the body of knowledge on the experiences of complementary therapy nurses and their perceptions of their satisfaction and wellness in healing environments.
