The global market for facial recognition

Facial recognition is a biometric tool

First, your face is captured with a photo or video

The software then measures a variety of facial features

the width of the nose

distance from forehead to chin

the coordinates of facial features

One early version of this technology

a high number of false positives

There is even a bar that uses facial recognition

with the biggest being its threat to an individual's privacy

Apps that allow individuals to use facial recognition software

produce far more false positives on non-white faces

anti-facial recognition glasses

the technology is increasingly used in mobile devices
