To start with, let's first get an understanding of what electricity is. Electricity is simply the movement of electric charge. The first question is, what makes it move and the first concept is voltage. Voltage is defined as electromotive force that moves electric charge around. It is measured by the difference of voltage.

So, let's consider that we have a computer power supply. In this case, it is powered by a powerful battery. In this example I am just using a battery because hopefully it is easier to understand. The battery has a positive and a negative end. The positive end has higher potential voltage. The negative end has lower potential voltage.

When we come in contact with electricity, either by touching an exposed wire or something that has become electrically charged, the electricity needs to go somewhere. Electricity like water will take the path of least resistance. The best path for electricity generally to go is the ground or the floor.
