Ritual and Domestic Life in Prehistoric Europe

This fascinating study explores how our prehistoric ancestors developed rituals from everyday life and domestic activities. Richard Bradley contends that for much of the prehistoric period, ritual was not a distinct sphere of activity. Rather it was the way in which different features of the domestic world were played out until they took on qualities of theatrical performance. With extensive illustrated case-studies, this book examines farming, craft production and the occupation of houses, all of which were ritualized in prehistoric Europe. Successive chapters discuss the ways in which ritual has been studied, drawing on a series of examples that range from Greece to Norway and from Romania to Portugal. They consider practices that extend from the Mesolithic period to the Early Middle Ages and discuss the ways in which ritual and domestic life were intertwined.

The Prehistory of Britain and Ireland

Sited at the furthest limits of the Neolithic revolution and standing at the confluence of the two great sea routes of prehistory, Britain and Ireland are distinct from continental Europe for much of the prehistoric sequence. In this landmark 2007 study - the first significant survey of the archaeology of Britain and Ireland for twenty years - Richard Bradley offers an interpretation of the unique archaeological record of these islands based on a wealth of current and largely unpublished data. Bradley surveys the entire archaeological sequence over a 4,000 year period, from the adoption of agriculture in the Neolithic period to the discovery of Britain and Ireland by travellers from the Mediterranean during the later pre-Roman Iron Age. Significantly, this is the first modern account to treat Britain and Ireland on equal terms, offering a detailed interpretation of the prehistory of both islands.

Economy and Society in Prehistoric Europe

This book brings together a classic collection of Andrew Sherratt's work on the economic foundations of prehistoric Europe, which have put forward important new ideas about the development of farming, pastoralism, early technology and trade. In a series of contributions that have included wide-ranging syntheses and detailed local studies, he discusses their implications for the understanding of settlement-patterns, social structures, material culture, and less tangible aspects of prehistoric life such as the spread of languages and the use of narcotics.

The Oxford Handbook of the Archaeology of Ritual and Religion

A comprehensive overview, by period and region, of the archaeology of ritual and religion. The coverage is global, and extends from the earliest prehistory to modern times. Written by over sixty renowned specialists, the Handbook presents the very best in current scholarship, and will also stimulate further research.

Women's Ritual Competence in the Greco-Roman Mediterranean

Contributions in this volume demonstrate how, across the ancient Mediterranean and over hundreds of years, women's rituals intersected with the political, economic, cultural, or religious spheres of their communities in a way that has only recently started to gain sustained academic attention. The volume aims to tease out a number of different approaches and contexts, and to expand existing studies of women in the ancient world as well as scholarship on religious and social history. The contributors face a famously difficult task: ancient authors rarely recorded aspects of women's lives, including their songs, prophecies, and prayers. Many of the objects women made and used in ritual were perishable and have not survived; certain kinds of ritual objects (lowly undecorated pots, for example) tend not even to be recorded in archaeological reports. However, the broad range of contributions in this volume demonstrates the multiplicity of materials that can be used as evidence – including inscriptions, textiles, ceramics, figurative art, and written sources – and the range of methodologies that can be used, from analysis of texts, images, and material evidence to cognitive and comparative approaches.

Making a Mark

The visual imagery of Neolithic Britain and Ireland is spectacular. While the imagery of passage tombs, such as Knowth and Newgrange, are well known the rich imagery on decorated portable artefacts is less well understood. How does the visual imagery found on decorated portable artefacts compare with other Neolithic imagery, such as passage tomb art and rock art? How do decorated portable artefacts relate chronologically to other examples of Neolithic imagery? Using cutting edge digital imaging techniques, the Making a Mark project examined Neolithic decorated portable artefacts of chalk, stone, bone, antler, and wood from three key regions: southern England and East Anglia; the Irish Sea region (Wales, the Isle of Man and eastern Ireland); and Northeast Scotland and Orkney. Digital analysis revealed, for the first time, the prevalence of practices of erasure and reworking amongst a host of decorated portable artefacts, changing our understanding of these enigmatic artefacts. Rather than mark making being a peripheral activity, we can now appreciate the central importance of mark making to the formation of Neolithic communities across Britain and Ireland. The volume visually documents and discusses the contexts of the decorated portable artefacts from each region, discusses the significance and chronology of practices of erasure and reworking, and compares these practices with those found in other Neolithic contexts, such as passage tomb art, rock art and pottery decoration. A contribution from Antonia Thomas also discusses the settlement art and mortuary art of Orkney, while Ian Dawson and Louisa Minkin contribute with a discussion of the collaborative fine art practices established during the project.

Between Worlds

The recent resurgence of academic interest in caves has demonstrated the central roles they played as arenas for ritual, ceremony and performance, and their importance within later prehistoric cosmologies. Caves represent very particular types of archaeological site and require novel approaches to their recording, interpretation and presentation. This is especially true in understanding the ritual use of caves, when the less tangible aspects of these environments would have been fundamental to the practices taking place within them. Between Worlds explores new theoretical frameworks that examine the agency of these enduring 'natural' places and the complex interplay between environment,

taphonomy and human activity. It also showcases the application of innovative technologies, such as 3D laser-scanning and acoustic modelling, which provide new and exciting ways of capturing the experiential qualities of these enigmatic sites. Together, these developments offer more nuanced understandings of the role of caves in prehistoric ritual, and allow for more effective communication, management and presentation of cave archaeology to a wide range of audiences.

The Oxford Handbook of the European Bronze Age

The Oxford Handbook of the European Bronze Age is a wide-ranging survey of a crucial period in prehistory during which many social, economic, and technological changes took place. Written by expert specialists in the field, the book provides coverage both of the themes that characterize the period, and of the specific developments that took place in the various countries of Europe. After an introduction and a discussion of chronology, successive chapters deal with settlement studies, burial analysis, hoards and hoarding, monumentality, rock art, cosmology, gender, and trade, as well as a series of articles on specific technologies and crafts (such as transport, metals, glass, salt, textiles, and weighing). The second half of the book covers each country in turn. From Ireland to Russia, Scandinavia to Sicily, every area is considered, and up to date information on important recent finds is discussed in detail. The book is the first to consider the whole of the European Bronze Age in both geographical and thematic terms, and will be the standard book on the subject for the foreseeable future.

Trees and Timber in the Anglo-Saxon World

The very first collection of essays written about the role of trees in early medieval England, bringing together established specialists and new voices to present an interdisciplinary insight into the complex relationship between the early English and their woodlands.

Challenging Preconceptions of the European Iron Age

This collection of essays by leading researchers in the archaeology of the European Iron Age pays tribute to Professor John Collis who, since the 1960s, has been involved in investigating and enriching our understanding of Iron Age society and, crucially, questioning the status quo of our narratives about the past.

Death and Changing Rituals

The forms by which a deceased person may be brought to rest are as many as there are causes of death. In most societies the disposal of the corpse is accompanied by some form of celebration or ritual which may range from a simple act of deportment in solitude to the engagement of large masses of people in laborious and creative festivities. In a funerary context the term ritual may be taken to represent a process that incorporates all the actions performed and thoughts expressed in connection with a dying and dead person, from the preparatory pre-death stages to the final deposition of the corpse and the post-mortem stages of grief and commemoration. The contributions presented here are focused not on the examination of different funerary practices, their function and meaning, but on the changes of such rituals _ how and when they occurred and how they may be explained. Based on case studies from a range of geographical regions and from different prehistoric and historical periods, a range of key themes are examined concerning belief and ritual, body and deposition, place, performance and commemoration, exploring a complex web of practices.

Eight Human Skulls in a Dung Heap and More

The study of ritual practice in the past is an accepted part of archaeological research these days. Yet, its theoretical basis is still not fully mature. This book aims at making a contribution to the study of ritual practice in the past by assembling a theoretical framework, which is tailored to the needs of archaeology, and which helps to identify and interpret the remains of rituals in the past. This framework is applied in a special archaeological region: the coastal area of the northern Netherlands, a former salt marsh area. In the past, people lived here on artificial dwelling mounds, so-called terps. Preservation conditions are excellent in this wetland area. This study makes use of the well-preserved remains of rituals in terps, to examine the role of ritual practice in the societies of the pre-Roman and Roman Iron Age in this area.

Architecture of First Societies

ARCHITECTURE OF FIRST SOCIETIES THIS LANDMARK STUDY TRACES THE BEGINNINGS OF ARCHITECTURE BY LOOKING AT THE LATEST ARCHAEOLOGICAL AND ANTHROPOLOGICAL RESEARCH From the dawn of human society, through early civilizations, to pre-Columbian American societies, *Architecture of First Societies* traces the different cultural formations that developed in various places throughout the world to form the built environment. It is the first book to explore the beginnings of architecture from a global perspective. Viewing ancient cultures through a lens of both time and geography, this history of early architecture brings its subjects to life with full-color photographs, maps, and drawings. The author cites the latest discoveries and analyses in archaeology and anthropology and discovers links to the past by examining how indigenous societies build today. "Encounters with Modernity" sections examine some of the political issues that village life and its architectural traditions face in the modern world. This fascinating and engaging tour of our architectural past: Fills a gap in architectural education concerning early mankind, the emergence of First Society people, and the rise of early agricultural societies Presents the story of early architecture, written by the coauthor of the acclaimed *A Global History of Architecture* Uses the most current research to develop a global picture of human interaction and migration Features color and black-and-white photos and drawings that show site conditions as well as huts, houses, and other buildings under construction in cultures that still exist today Highlights global relationships with color maps Analyzes topics ranging in scale from landscape and culture to building techniques Helps us come to terms with our own modern approaches to historical conditions and anthropological pasts *Architecture of First Societies* is ideal reading for anyone who seeks a deeper understanding of the strong relationships between geography, ecology, culture, and architecture.

The Prehistory of Home

"The Prehistory of Home addresses a topic of widely shared interest, and provides easy-to-understand evidence and well-argued interpretations. Jerry Moore is deft with words, phrasing, and building arguments, shifting effortlessly between antiquity and today while keeping the themes of home and prehistory clear. Alongside the rigorous archaeological and scientific research, Moore's wit and personality shine throughout."—Wendy Ashmore, coauthor of *Household and Community in the Mesoamerican Past*

European Archaeology as Anthropology

Since the days of V. Gordon Childe, the study of the emergence of complex societies has been a central question in anthropological archaeology. However, archaeologists working in the Americanist tradition have drawn most of their models for the emergence of social complexity from research in the Middle East and Latin America. Bernard Wailes was a strong advocate for the importance of later prehistoric and early medieval Europe as an alternative model of sociopolitical evolution and trained generations of American archaeologists now active in European research from the Neolithic to the Middle Ages. Two centuries of excavation and research in Europe have produced one of the richest bodies of archaeological data anywhere in the world. The abundant data show that technological innovations such as metallurgy appeared very early, but urbanism and state formation are comparatively late developments. Key transformative process such as the spread of agriculture did not happen uniformly but rather at different rates in different regions. The essays in this volume celebrate the legacy of Bernard Wailes by highlighting the contribution of the European archaeological record to our understanding of the emergence of social complexity. They provide case studies in how ancient Europe can inform anthropological archaeology. Not only do they illuminate key research topics, they also invite archaeologists working in other parts of the world to consider comparisons to ancient Europe as they construct models for cultural development for their regions. Although there is a substantial corpus of literature on European prehistoric and medieval archaeology, we do not know of a comparable volume that explicitly focuses on the contribution that the study of ancient Europe can make to anthropological archaeology.

Woodland in the Neolithic of Northern Europe

A detailed consideration of the ways in which human-environment relations altered with the beginnings of agriculture in the Neolithic of northern Europe.

In the Darkest of Days

This book collects recent works on the subjects of sacrificial offerings, ritualized violence and the relative values thereof in the contexts of Scandinavian prehistory from the Neolithic to the Viking era. The volume builds on a workshop hosted at the National Museum of Denmark in 2018 which inaugurated the beginning of the research project 'Human Sacrifice and Value: The limits of sacred violence' and was supported by the Museum of Cultural History at the University of Oslo. The volume brings together research and perspectives that attempt to go beyond the who, what and where of most archaeological and anthropological investigations of sacrificial violence to address both the underlying and explicit forms of value associated with such events. The volume re-opens investigations into notions of value relating to diverse evidence and suggested evidence for human sacrifice and related ritualized violence. It covers a broad spectrum of issues relating to novel interpretations of the existing archaeological materials, but with a focus on the study of value and value dynamics in these diverse ritual contexts, engaging in questions of identity, cosmology, economics and social relations. Cases span from the Scandinavian Late Neolithic and Nordic Bronze Age, through to the well-known wetland deposits and bog bodies of the Iron Age, to Viking era executions, 'deviant' burials and contemporaneous double/multiple graves, exploring the implications for the transformation of sacrificial practices across Scandinavian prehistory. Each contribution attempts to untangle the myriad forms of value at play in different incarnations of human offerings, and provide insights into how those values were expressed, e.g., in the selection and treatment of victims in relation to their status, personhood, identity and life-history.

The Prehistory of Iberia

This volume advances the archaeological study of social organisation in Prehistory, and more specifically the rise of social complexity in European Prehistory. Within the wider context of world Prehistory, in the last 30 years the subject of early social stratification and state formation has been a key subject on interest in Iberian Prehistory. This book illustrates the differing forms of resistances, the interplay between change and continuity, the multiple paths to and from social complexity, and the 'failures' of states to form in Prehistory. Focusing on Iberia, but with a permanent connection to the wider geographical framework, this book presents, for the first time, a chronologically comprehensive, up-to-date approach to the issue of state formation in prehistoric Europe.

Ritual Failure

'Ritual Failure' is a new concept in archaeology adopted from the discipline of anthropology. Resilient religious systems disappearing, strict believers and faithful practitioners not performing their rites, entire societies changing their customs: how does a religious ritual system transform, change or disappear, leaving only traces of its past glory? Do societies change and then their ritual? Or do customs change first, in turn provoking wider cultural shifts in society? Archaeology possesses the tools and methodologies to explore these questions over the long term; from the emergence of a system, to its peak, and then its decay and disappearance, and in relation to wider social and chronological developments. The collected papers in this book introduce the concept of 'ritual failure' to archaeology. The analysis explores ways in which ritual may have been instrumental in sustaining cultural continuity during demanding social conditions, or how its functionality might have failed – resulting in discontinuity, change or collapse. The collected papers draw attention to those turbulent social times of change for which ritual practices are a sensitive indicator within the archaeological record. The book reviews archaeological evidence and theoretical approaches, and suggests models which could explain socio-cultural change through ritual failure. The concept of 'ritual failure' is also often used to better understand other themes, such as identity and wider social, economic and political transformations, shedding light on the social conditions that forced or introduced change. This book will engage those interested in ritual theory and practices, but will also appeal to those interested in exploring new avenues to understanding cultural change. From transformations in the use of ritual objects to the risks inherent in practicing ritual, from ritual continuity in customs to sudden and profound change, from the Neolithic Near East to Roman Europe and Iron Age Africa, this book explores what happens when ritual fails.

Settlement in the Irish Neolithic

The Irish Neolithic has been dominated by the study of megalithic tombs, but the defining element of Irish settlement evidence is the rectangular timber Early Neolithic house, the numbers of which have more than quadrupled in the last ten years. The substantial Early Neolithic timber house was a

short-lived architectural phenomenon of as little as 90 years, perhaps like short-lived Early Neolithic long barrows and causewayed enclosures. This book explores the wealth of evidence for settlement and houses throughout the Irish Neolithic, in relation to Britain and continental Europe. More importantly it incorporates the wealth of new, and often unpublished, evidence from developer-led archaeological excavations and large grey-literature resources. The settlement evidence scattered across the landscape, and found as a result of developer-funded work, provides the social context for the more famous stone monuments that have traditionally shaped our views of the Neolithic in Ireland. It provides the first comprehensive review of the Neolithic settlement of Ireland, which enables a more holistic and meaningful understanding of the Irish Neolithic.

Solarizing the Moon: Essays in honour of Lionel Sims

Lionel Sims has produced an influential body of work that has challenged existing narratives about British prehistoric monuments and provided innovative ways to approach and think about skylines. This book, in his honour, is divided into three parts: Anthropology and Human Origins, Prehistory and Megalithic Monuments, and Theory.

Knowledge and Power in Prehistoric Societies

This book explores the role of formal knowledge systems in small-scale oral cultures in both historic and archaeological contexts.

The Routledge Handbook of the Bioarchaeology of Human Conflict

If human burials were our only window onto the past, what story would they tell? Skeletal injuries constitute the most direct and unambiguous evidence for violence in the past. Whereas weapons or defenses may simply be statements of prestige or status and written sources are characteristically biased and incomplete, human remains offer clear and unequivocal evidence of physical aggression reaching as far back as we have burials to examine. Warfare is often described as 'senseless' and as having no place in society. Consequently, its place in social relations and societal change remains obscure. The studies in The Routledge Handbook of the Bioarchaeology of Human Conflict present an overview of the nature and development of human conflict from prehistory to recent times as evidenced by the remains of past people themselves in order to explore the social contexts in which such injuries were inflicted. A broadly chronological approach is taken from prehistory through to recent conflicts, however this book is not simply a catalogue of injuries illustrating weapon development or a narrative detailing 'progress' in warfare but rather provides a framework in which to explore both continuity and change based on a range of important themes which hold continuing relevance throughout human development.

A Companion to the Archaeology of Religion in the Ancient World

A Companion to the Archaeology of Religion in the Ancient World presents a comprehensive overview of a wide range of topics relating to the practices, expressions, and interactions of religion in antiquity, primarily in the Greco-Roman world. • Features readings that focus on religious experience and expression in the ancient world rather than solely on religious belief • Places a strong emphasis on domestic and individual religious practice • Represents the first time that the concept of "lived religion" is applied to the ancient history of religion and archaeology of religion • Includes cutting-edge data taken from top contemporary researchers and theorists in the field • Examines a large variety of themes and religious traditions across a wide geographical area and chronological span • Written to appeal equally to archaeologists and historians of religion

The Chinchorro culture

Europe is dotted with tens of thousands of prehistoric barrows. In spite of their ubiquity, little is known on the role they had in pre- and protohistoric landscapes. In 2010, an international group of archaeologists came together at the conference of the European Association of Archaeologists in The Hague to discuss and review current research on this topic. This book presents the proceedings of that session. The focus is on the prehistory of Scandinavia and the Low Countries, but also includes an excursion to huge prehistoric mounds in the southeast of North America. One contribution presents new evidence on how the immediate environment of Neolithic Funnel Beaker (TRB) culture megaliths was ordered, another one discusses the role of remarkable single and double post alignments around Bronze and

Iron Age burial mounds. Zooming out, several chapters deal with the place of barrows in the broader landscape. The significance of humanly-managed heath in relation to barrow groups is discussed, and one contribution emphasizes how barrow orderings not only reflect spatial organization, but are also important as conceptual anchors structuring prehistoric perception. Other authors, dealing with Early Neolithic persistent places and with Late Bronze Age/Early Iron Age urnfields, argue that we should also look beyond monumentality in order to understand long-term use of "ritual landscapes". The book contains an important contribution by the well-known Swedish archaeologist Tore Artelius on how Bronze Age barrows were structurally re-used by pre-Christian Vikings. This is his last article, written briefly before his death. This book is dedicated to his memory. This publication is part of the Ancestral Mounds Research Project of the University of Leiden.

Beyond Barrows

Ritual happens in distinct places Ð in temples, in caves, along pilgrimage routes Ð and religious activities there incorporate a diverse set of objects such as holy water, cult statues, and sacred texts. Understanding religious ritual requires viewing it not as a disembodied event, but as emplaced, grounded in both built and natural surroundings, and integrated with its associated material objects. Here authors examine various religious practices in the Greco-Roman world and pilgrimage routes in contemporary Israel. Other contributions focus on the East, on domestic religion in prehistoric Taiwan, and the palimpsest of ritual activity in Buddhist China. One author considers not just ritual's built and natural setting, but also the landscape of the human mind. By way of conclusion, many of the recurring issues concerning the material and topographic matrix of ritual practice are expanded upon in a final meditation on sacred space. The papers in this volume, with their disciplinary, geographic, and chronological diversity, will serve as a resource for theoretical approaches to the study of ritual practice that may have broad cross-cultural application and provide new insight into the relationship between ritual and place. The volume is based on a conference held at Brown University.

Locating the Sacred

Fowler presents a detailed study of Chalcolithic and Early Bronze Age mortuary practices based on a reading of recent relational theories in archaeology and other disciplines. It provides the first ever synthesis of Early Bronze Age burials in Northeast England, examining a dataset of over 350 burials across 150 different archaeological sites.

The Emergent Past

The Companion to Ancient Israel offers an innovative overview of ancient Israelite culture and history, richly informed by a variety of approaches and fields. Distinguished scholars provide original contributions that explore the tradition in all its complexity, multiplicity and diversity. A methodologically sophisticated overview of ancient Israelite culture that provides insights into political and social history, culture, and methodology Explores what we can say about the cultures and history of the people of Israel and Judah, but also investigates how we know what we know Presents fresh insights, richly informed by a variety of approaches and fields Delves into 'religion as lived,' an approach that asks about the everyday lives of ordinary people and the material cultures that they construct and experience Each essay is an original contribution to the subject

The Wiley Blackwell Companion to Ancient Israel

This volume contains a selection of papers presented at TRAC 2014, as well as some invited contributions. In keeping with the aims of TRAC, several papers make innovative use of interdisciplinary theory: in humanistic geography, philosophy and archaeology; social psychology; and the cognitive science of religion in the study of Roman monuments, military social history and religion. Other papers share a common theme: the critical interpretation of archaeological evidence. A more careful consideration of non-grave good pottery sherds from graves suggests that these often disregarded items potentially shed light on funerary rites which are usually considered to be invisible; the potential importance of plant remains, particularly of exotic and rare species, in ritual deposits is examined and a new perspective on the negative aspects of Roman conquest of Northern Gaul presented. New approaches towards our understanding of space and landscape in the Roman world comprise an examination of the suburbs of ancient Rome and preliminary results of an ongoing project exploring the relationship between wetland landscapes and domestic settlements, presenting a case study from Spain.

TRAC 2014

A large-scale investigation into grave goods (c. 4000 BC-AD 43), enabling a new level of understanding of mortuary practice, material culture, technological innovation and social transformation.

Grave Goods

Broken Bodies, Places and Objects demonstrates the breadth of fragmentation and fragment use in prehistory and history and provides an up-to-date insight into current archaeological thinking around the topic. A seal broken and shared by two trade parties, dog jaws accompanying the dead in Mesolithic burials, fragments of ancient warships commodified as souvenirs, parts of an ancient dynastic throne split up between different colonial collections... Pieces of the past are everywhere around us. Fragments have a special potential precisely because of their incomplete format – as a new matter that can reference its original whole but can also live on with new, unrelated meanings. Deliberate breakage of bodies, places and objects for the use of fragments has been attested from all time periods in the past. It has now been over 20 years since John Chapman's major publication introducing fragmentation studies, and the topic is more present than ever in archaeology. This volume offers the first European-wide review of the concept of fragmentation, collecting case studies from the Neolithic to Modernity and extending the ideas of fragmentation theory in new directions. The book is written for scholars and students in archaeology, but it is also relevant for neighbouring fields with an interest in material culture, such as anthropology, history, cultural heritage studies, museology, art and architecture.

An Archaeological History of Indian Buddhism

This volume is the second of the series Corollaria Crustumina aimed at the publication of conference proceedings, doctoral theses and specialist studies concerning the Latin settlement of Crustumerium (Rome) and Italian protohistory. It contains multidisciplinary papers of an international group of archaeologists discussing new fieldwork data and theories of broad relevance to Italian archaeology and with specific relevance to the study of Crustumerium's settlement, cemeteries and material culture in light of the site's cultural identity.

Early Life

Discusses the Cambrian era in Earth's history, when the first forms of life appeared and began to flourish and evolve.

Early Life

Examines evolution in the Cambrian period during which multicellular organisms first began to appear in fossilized form.

The Cambrian Period

*Includes pictures *Includes a bibliography for further reading The early history of Earth covers such vast stretches of time that years, centuries, and even millennia become virtually meaningless. Instead, paleontologists and scientists who study geochronology divide time into periods and eras. The current view of science is that Earth is around 4.6 billion years old, and the first 4 billion years of its development are known as the Precambrian period. For the first billion years or so, there was no life in Earth. Then the first single-celled life-forms, early bacteria and algae, began to emerge. It's unclear where they came from or even if they originated on this planet at all, but this gradual development continued until around four billion years ago when suddenly (in geological terms) more complex forms of life began to emerge. Scientists call this time of an explosion of new forms of life the Paleozoic Era, and it stretched from around 541-250 million years ago (Mya). In the oceans and then on land, new creatures and plants began to appear in bewildering variety, and by the end of this period, life on Earth had diversified into a myriad of complex forms that filled virtually every habitat and niche available in the seas and on the planet's only continent, Pangea. Despite all of the scientific advances made in the past few centuries, including an enhanced understanding of Earth's geological past, very little is known about the planet's early history. It is generally accepted that the planet formed somewhere in the region of 4.5 billion years ago, and at some point, the first life appeared in the form of tiny, single-celled creatures, but scientists are unsure of what this life looked like. One of the problems for those seeking to trace the history of life on Earth is that modern scholars are almost entirely dependent on fossil records, but the earliest types of life left few fossils. The best fossils are formed from the bones and hard body parts of dead creatures, but the earliest types of life were so small that they had no bones or cartilage and thus left no fossils. Thus, even though the Precambrian Period (4,600-541 millions of years ago (Mya)) covers over 80% of the entire history of the planet, scientists have very little idea of what forms of life existed then. Then, as Earth entered the Cambrian Period, there was a relatively sudden increase in life form diversity throughout the oceans. Completely new forms of life, more complex and more diverse than anything that had been seen before, began to spread. This acceleration in the evolution of new forms of life was so dramatic that this has come to be known as the "Cambrian explosion." Although new species in the Cambrian explosion developed almost entirely in the oceans, the land was not entirely devoid of life. Though there were no plants or animals, mats of cyanobacteria and other types of microbes covered large terrestrial areas. Scientists have discovered the tracks of a creature that were left in mud that existed 551 Mya, and those tracks were left by leg-like appendages. Was this a fish-like creature that temporarily invaded the land, or was it something completely different than anything that exists today? There is no general consensus, but the Cambrian Period left a rich fossil record that provides a clear idea of the development of life during this time. At the same time, new discoveries are continually being made, and the more scientists discover about this mysterious period, the more their understanding of ancient Earth changes. The Cambrian Period: The History and Legacy of the Start of Complex Life on Earth looks at the development of the era, the extinction event that preceded it, and how life began to evolve during it. Along with pictures depicting important people, places, and events, you will learn about the Cambrian Period like never before.

Early Life on Earth

This study is organized around three themes: the origin and early diversification of life during the Archean Eon; the maturation of life and the Earth during the long Proterozoic Eon; and the explosive diversification of multicellular life that marks the dawn of the Phanerozoic Eon. The contributors discuss the coherence of history, the combinatorial generation of taxonomic diversity, early Metazoan evolution, and the Cambrian explosion.

The First Vertebrates

One of the greatest mysteries in reconstructing the history of life on Earth has been the apparent absence of fossils dating back more than 550 million years. We have long known that fossils of sophisticated marine life-forms existed at the dawn of the Cambrian Period, but until recently scientists had found no traces of Precambrian fossils. The quest to find such traces began in earnest in the mid-1960s and culminated in one dramatic moment in 1993 when William Schopf identified fossilized microorganisms three and a half billion years old. This startling find opened up a vast period of time--some eighty-five percent of Earth's history--to new research and new ideas about life's beginnings. In this book, William Schopf, a pioneer of modern paleobiology, tells for the first time the exciting and fascinating story of the origins and earliest evolution of life and how that story has been unearthed. Gracefully blending his personal story of discovery with the basics needed to understand the astonishing science he describes, Schopf has produced an introduction to paleobiology for the interested reader as well as a primer for beginning students in the field. He considers such questions as how did primitive bacteria, pond scum, evolve into the complex life-forms found at the beginning of the Cambrian Period? How do scientists identify ancient microbes and what do these tiny creatures tell us about the environment of the early Earth? (And, in a related chapter, Schopf discusses his role in the controversy that swirls around recent claims of fossils in the famed meteorite from Mars.) Like all great teachers, Schopf teaches the non-specialist enough about his subject along the way that we can easily follow his descriptions of the geology, biology, and chemistry behind these discoveries. Anyone interested in the intriguing questions of the origins of life on Earth and how those origins have been discovered will find this story the best place to start.

Planet Earth

This volume, aimed at the general reader, presents life and times of the amazing animals that inhabited Earth more than 500 million years ago. The Cambrian Period was a critical time in Earth's history. During this immense span of time nearly every modern group of animals appeared. Although life had been around for more than 2 million millennia, Cambrian rocks preserve the record of the first appearance of complex animals with eyes, protective skeletons, antennae, and complex ecologies. Grazing, predation, and multi-tiered ecosystems with animals living in, on, or above the sea floor became common. The cascade of interaction led to an ever-increasing diversification of animal body types. By the end of the period, the ancestors of sponges, corals, jellyfish, worms, mollusks, brachiopods, arthropods, echinoderms, and vertebrates were all in place. The evidence of this Cambrian "explosion" is preserved in rocks all over the world, including North America, where the seemingly strange animals of the period are preserved in exquisite detail in deposits such as the Burgess Shale in British Columbia. *Cambrian Ocean World* tells the story of what is, for us, the most important period in our planet's long history.

Cradle of Life

Vertebrates are the most familiar of all animals on Earth, with humans being but one of about 45,000 species of living vertebrates. The rise of the first vertebrates is synonymous with the Paleozoic era, a span of increasing ecological complexity where the first explosion of life occurred in the seas. In this fully illustrated volume, *The First Vertebrates* examines the dramatic rise of vertebrate life in the Paleozoic seas with the development of early fish, including jawless fish, fish with teeth and jaws, early sharks and other cartilaginous fish, and bony fish, the ancestors of most present-day fish species.

Cambrian Ocean World

The early history of Earth covers such vast stretches of time that years, centuries, and even millennia become virtually meaningless. Instead, paleontologists and scientists who study geochronology divide time into periods and eras. The current view of science is that Earth is around 4.6 billion years old, and the first 4 billion years of its development are known as the Precambrian period. For the first billion years or so, there was no life in Earth, and then the first single-celled life-forms, early bacteria and algae, began to emerge. It's unclear where they came from or even if they originated on this planet at all, but this gradual development continued until around 4 billion years ago when suddenly (in geological terms) more complex forms of life began to emerge. Although new species in the Cambrian explosion developed almost entirely in the oceans, the land was not entirely devoid of life. Though there were no plants or animals, mats of cyanobacteria and other types of microbes covered large terrestrial areas. Scientists have discovered the tracks of a creature that were left in mud that existed 551

Mya, and those tracks were left by leg-like appendages. Was this a fish-like creature that temporarily invaded the land, or was it something completely different than anything that exists today? There is no general consensus, but the Cambrian Period left a rich fossil record that provides a clear idea of the development of life during this time. At the same time, new discoveries are continually being made, and the more scientists discover about this mysterious period, the more their understanding of ancient Earth changes. The Silurian Age occurred during the mid-Paleozoic, and despite its relative brevity, the era developed some interesting features that promulgated life on Earth. Roderick J. Murchison, a British geologist, named a sequence of rocks after a group of indigenous people called the Silures living in Wales during the mid-19th century. Despite their absence in the Silurian Age, the name was bestowed to honor the tribe. Murchison was inspired by close friend Adam Sedgwick, who named the Cambrian Age, employing the Latin word for Wales. In 1835, the two presented a paper together entitled *On the Silurian and Cambrian Systems*. Their separate categorizing systems caused a serious enough disagreement over chronology that the friendship ended bitterly. The alternative name for Siluria was Gotlandia after the Baltica island of Gotland. What ultimately precipitated these subdivisions in the chronology was a "famous unconformity" on the River Onny in Shropshire. It indicated a natural break within "classic Silurian on its own home territory." The timeline for beginning and end dates has remained imprecise, but the order of fossilized discoveries has proven correct. Joachim Barrande, a French paleontologist, geologist, and botanist, pursued the same issue in the Prague Basin of Bohemia. Studying the Paleozoic trilobite for a period of 10 years, his extensive work was published in his *Silurian System of Central Bohemia*. Altogether, he identified and analyzed over 4,000 new fossil species, producing the enormous *Encyclopedia of Fossils*, numbering over 6,000 pages.

The Silurian Period

Darwin made a powerful argument for evolution in the *Origin of Species*, based on all the evidence available to him. But a few things puzzled him. One was how inheritance works - he did not know about genes. This book concerns another of Darwin's Dilemmas, and the efforts of modern palaeontologists to solve it. What puzzled Darwin is that the most very ancient rocks, before the Cambrian, seemed to be barren, when he would expect them to be teeming with life. Darwin speculated that this was probably because the fossils had not been found yet. Decades of work by modern palaeontologists have indeed brought us amazing fossils from far beyond the Cambrian, from the depths of the Precambrian, so life was certainly around. Yet the fossils are enigmatic, and something does seem to happen around the Cambrian to speed up evolution drastically and produce many of the early forms of animals we know today. In this book, Martin Brasier, a leading palaeontologist working on early life, takes us into the deep, dark ages of the Precambrian to explore Darwin's Lost World. Decoding the evidence in these ancient rocks, piecing together the puzzle of what happened over 540 million years ago to drive what is known as the Cambrian Explosion, is very difficult. The world was vastly different then from the one we know now, and we are in terrain with few familiar landmarks. Brasier is a master storyteller, and combines

the account of what we now know of the strange creatures of these ancient times with engaging and amusing anecdotes from his expeditions to Siberia, Outer Mongolia, Barbuda, and other places, giving a vivid impression of the people, places, and challenges involved in such work. He ends by presenting his own take on the Cambrian Explosion, based on the picture emerging from this very active field of research. A vital clue involves worms - burrowing worms are one of the key signs of the start of the Cambrian. This is fitting: Darwin was inordinately fond of worms.

The Ancient Life-history of the Earth

It may be hard to believe that the Earth, with all the complexity and biodiversity we observe today, originated in a cloud of gas and dust. Yet much of the plant and animal life that seems so common now evolved relatively recently on the timeline of Earth's long history. The Earth's remarkable origins are chronicled in this insightful volume, which also examines the prehistoric organisms—from bacteria to dinosaurs—that populated the planet long before humans arrived.

Let's Discover the Prehistoric World

How did the earth look in prehistoric times? Scientists and artists collaborated during the half-century prior to the publication of Darwin's Origin of Species to produce the first images of dinosaurs and the world they inhabited. Their interpretations, informed by recent fossil discoveries, were the first efforts to represent the prehistoric world based on sources other than the Bible. Martin J. S. Rudwick presents more than a hundred rare illustrations from the eighteenth and nineteenth centuries to explore the implications of reconstructing a past no one has ever seen.

Scenes from Deep Time

For 65 million years dinosaurs ruled the Earth-until a deadly asteroid forced their extinction. But what accounts for the incredible longevity of dinosaurs? A renowned scientist now provides a startling explanation that is rewriting the history of the Age of Dinosaurs. Dinosaurs were pretty amazing creatures-real-life monsters that have the power to fascinate us. And their fiery Hollywood ending only serves to make the story that much more dramatic. But fossil evidence demonstrates that dinosaurs survived several mass extinctions, and were seemingly unaffected by catastrophes that decimated most other life on Earth. What could explain their uncanny ability to endure through the ages? Biologist and earth scientist Peter Ward now accounts for the remarkable indestructibility of dinosaurs by connecting their unusual respiration system with their ability to adapt to Earth's changing environment-a system that was ultimately bequeathed to their descendants, birds. By tracing the evolutionary path back through time and carefully connecting the dots from birds to dinosaurs, Ward describes the unique form of breathing shared by these two distant relatives and demonstrates how this simple but remarkable characteristic provides the elusive explanation to a question that has thus far stumped scientists. Nothing short of revolutionary in its bold presentation of an astonishing theory, *Out of Thin Air* is a story of science at the edge of discovery. Ward is an outstanding guide to the process of scientific detection. Audacious and innovative in his thinking, meticulous and thoroughly detailed in his research, only a scientist of his caliber is capable of telling this surprising story.

The Ancient Life-history of the Earth

This volume provides a detailed description of a wide range of numerical, statistical or modeling techniques and novel instrumentation separated into individual chapters written by paleontologists with expertise in the given methodology. Each chapter outlines the strengths and limitations of specific numerical or technological approaches, and ultimately applies the chosen method to a real fossil dataset or sample type. A unifying theme throughout the book is the evaluation of fossils during the prologue and epilogue of one of the most exciting events in Earth History: the Cambrian radiation.

Time of the Giants

Prehistoric life is the archive of evolution preserved in the fossil record. This book focuses on the meaning and significance of that archive and is designed for introductory college science students, including non-science majors, enrolled in survey courses emphasizing paleontology, geology and biology. From the origins of animals to the evolution of rap music, from ancient mass extinctions to the current biodiversity crisis, and from the Snowball Earth to present day climate change this book covers it, with an eye towards showing how past life on Earth puts the modern world into its proper context. The history of life and the patterns and processes of evolution are especially emphasized, as are the interconnections between our planet, its climate system, and its varied life forms. The book does not just describe the history of life, but uses actual examples from life's history to illustrate important concepts and theories.

Discovering the Prehistoric World

From its beginnings as an accumulation of molten space debris over 4.6 billion years ago, the Earth has undergone astounding transformations, both geological and biological, to arrive at its familiar look today. The Discovery Channel's Atlas of the Prehistoric World is a dynamic portrait of the Earth and the interplay among the various forces that shaped both the planet and the life upon it. Atlas of the Prehistoric World is divided into three major sections, each of which offers a distinctive look at our planet's pre-history. In "The Changing Globe" computer-generated global maps track the Earth's shift in topography during eighteen different geological periods.... From the rise of mountain ranges to the creation of new oceans, the world takes on its different faces through the course of eons. "Life on Earth" chronicles the evolution of plant and animal life, from the first single-celled microbes to land-dwelling mammals. Each of the Earth's major geological eras is profiled in its own chapter, which depicts the life forms that developed as continents drifted, volcanoes erupted, and meteorites crashed to the surface. Specially commissioned panoramic illustrations take "snapshots" of life at a particular time and place.... These... reflect the latest scientific thinking about how creatures from each period would have appeared, bringing to life animals and plant life we can otherwise see only as fossils. "Earth Fact File," an indispensable gazetteer, explains important Earth science concepts and provides a useful tool for understanding prehistory. Accompanied by over 250 full-color photographs and illustrations and 68 maps, the Discovery Channel's Atlas of the Prehistoric World is a unique must-have resource for any family member.
