We do, however, repair the vast majority of imperfections successfully; any imperfections that remain are intentionally left to preserve the state of such historical works.

The American Journal of Obstetrics and Diseases of Women and Children, Vol. 35: January-June, 1897 (Classic Reprint)

Excerpt from The American Journal of Obstetrics and Diseases of Women and Children, Vol. 74: July-December, 1916 There can be little difference of Opinion regarding the treatment of the acute form of retrodisplacement of the uterus. This condition occurs more Often than is supposed, but is mistaken for some other acute pelvic or abdominal lesion. The resulting pain is usually severe at first, gradually lessening by rest and position until the condition, unrecognized, passes into the chronic form. The chronic form of retrodisplacement seems an ever-present pathologic problem and as long as there exists a diversity of opinion among students of gynecology regarding its surgical treatment, further study is demanded. The American Journal of Obstetrics and Diseases of Women and Children, Vol. 69: July-December, 1914 (Classic Reprint)

Excerpt from The American Journal of Obstetrics and Diseases of Women and Children, Vol. 79: January-June, 1919 During the last decade there has been a gradually growing recognition of the fact that obstetrics is a surgical specialty. In accord with this rather reluctant and surely very tardy acknowledgment, obstetric leaders have been actively voicing the need for more careful obstetric training and more rigid technic. We do, however, repair the vast majority of imperfections successfully; any imperfections that remain are intentionally left to preserve the state of such historical works.

The American Journal of Obstetrics and Diseases of Women and Children, Vol. 52

Excerpt from American Journal of Obstetrics and Diseases of Women and Children, Vol. 63: January-June, 1911 When the hemorrhage is severe and the cervix admits two or more fingers, the best results, as far as the mother is concerned, are Obtained by the performance of Braxton Hicks' or internal podalic version, using the child's thigh and buttocks as a tampon. This method gives a high fetal mortality Of about 60 per cent., but the maternal is reduced to about 3 to 6 per cent. In this relation it is important to emphasize the necessity of the slow extraction Of the child after the foot has been brought down; for if rapid delivery be attempted with an incompletely dilated cervix, rupture of the lower uterine segment with the attendant mortality will deprive the method Of all its advantages. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Find more at www.forgottenbooks.com This book is a reproduction of an important historical work. American Journal of Obstetrics and Diseases of Women and Children, Vol. 63

Excerpt from The American Journal of Obstetrics and Diseases of Women and Children, Vol. 45: January-June, 1902 Vice-president of the American Association of Obstetricians and Gynecologists

and Honorary Member of the Surgical Society of Belgium. Etc Boston, Mass. Obstetricians have in the past formulated the rule that a pregnant woman afflicted with carcinoma of the cervix was practically lost to all resources of medical art, and they argued that. As the pregnancy would in most cases go on to term, everything should be sacrificed to save the offspring and that an operation on the mother was out of the question. But as a surgeon I would reason as one, and I believe that carcinoma of the cervix. When diagnosed and operated on in time - that is to say. Before any extension beyond the uterine tissues has occurred - will give a long survival and a prolonged, if not to say complete, cure; and in this paper I shall endeavor to demonstrate that radical operations are indicated in a very large per cent of these cases, thus reversing the obstetrical ruling. Read before the Section of Diseases of Women of the Suffolk District Medical Society, January 22, 1902. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. The American Journal of Obstetrics and Diseases of Women and Children, Vol. 76: July-December, 1917 (Classic Reprint)

Excerpt from The American Journal of Obstetrics and Diseases of Women and Children, Vol. 72: July-December, 1915 It is generally stated by German writers that pubiotomy is contraindicated in primiparous women except in unusual circum stances on account of the danger of deep communicating vaginal tears and of injury to the bladder. No doubt this is correct unless especial precautions are taken to prevent such complications; but in my experience they need not occur more frequently than in multiparous women, provided the vulva and lower vagina have been dilated manually before beginning the operation. This being the case, it is interesting to inquire whether there was any difference in the incidence of spontaneous labor in the two classes of women. American Journal of Obstetrics and Diseases of Women and Children

Excerpt from The American Journal of Obstetrics and Diseases of Women and Children, Vol. 64: June-December 1911 Among the newer Obstetric Operations which have interested me during the past few years, the Operation of Dührssen, vaginal hysterotomy or, as it is more commonly known, vaginal Cesarean section, has held a prominent place. The idea of the Operation has appealed to me, as it must to any one surgically trained. A clean-cut tissue is always preferable to one which has been divulsed and in this Operation it was proposed to cut rather than to tear.
