Financial Distress

Short-Term Interest Rate

Example

The Yield Curve

Inflation Causes

Where Does the Fed Get All Their Money

Future Rates and Forward Rates

Multi-Year Forward Rates

And You'D Like To Be Able To Pay It Out in Year Two and You Want To Do that All Today so How Do You Do that Well You Go to the Financial Markets and You Look at the Yield Curve and You See What the One-Year Rate Is and What the 2-Year Rate Is and What You Get from Looking at the Newspaper Is the One-Year Rate Is 5 % and the 2-Year Rate Is 7 % Question Is 7 % a Spot Rate Forward Rate or Future Spot Rate It's a Spot Rate of What

How Do You Go about Locking in the Rate between Years One and Two Well Here's a Really Cool Transaction That You Can Do Today Borrow Nine Point Five to Four Million Dollars for a Year How Do You Know You Can Do that Exactly You've Got the One Your Interest Rated 5 % so if that's Really a Market Rate That Means that You Should Be Able To Borrow at that Rate Okay so When You're Borrowing Money What Are You Doing

And Really the Theory behind Coupon Bonds Is Virtually Identical to that of Discount Bonds in the Sense that You Can Always Look at a Coupon Bond as a Package of Discount Bonds Right That's Sort of the Opposite of a Strip a Strip Takes a Coupon Bond and Breaks It Up into What Looked like Little Discount Bonds Well if You Think about What a Coupon Bond Is It's Really Just a Collection of Discount Bonds at Different Maturities That's the Way To Think about It

If You Think about What a Coupon Bond Is It's Really Just a Collection of Discount Bonds at Different Maturities That's the Way To Think about It So Here's a Simple Example a Three-Year Bond with a 5 % Coupon Is Going To Look like this It's Going To Pay Fifty Fifty and Then a Thousand Fifty Now as I Mentioned There Are some Coupon Bonds That Pay Semi-Annually so When They Say that There's a Coupon of Three Percent It's Three Percent every Six Months so You Have To Take that into Account When You're Computing the Present Values of these Objects

So Here's a Simple Example a Three-Year Bond with a 5 % Coupon Is Going To Look like this It's Going To Pay Fifty Fifty and Then a Thousand Fifty Now as I Mentioned There Are some Coupon Bonds That Pay Semi-Annually so When They Say that There's a Coupon of Three Percent It's Three Percent every Six Months so You Have To Take that into Account When You're Computing the Present Values of these Objects How Do We Do It Exactly the Same Way as We Do for Pure Discount Bonds Take the Coupons each of Them and Discount Them Back to the Present

We Can Also Calculate an Average of all of those Little R's and Just Use One Variable and To Simplify Notation I'm Going To Give It a Completely Different Symbol Y and Say What Is that Single Number Y That Will Give Me the Price of the Bond and that Y Is Known as the Particular Bonds Yield It Is the Single Interest Rate Which if Interest Rates Were Constant throughout Time Would Make the Present Value of All the Coupons and Principal Equal to the Current Price Okay so if You Think about a Mortgage

This Is a Plot of the Time Series of One-Year Yields over Time and You Can See that Starting in the When the Sample Began in 1982 the One-Year Yield for Us Treasury Bills Is 12 % 12 % Back in 1982 and There's a Point at Which One of the Longer Maturity Instruments Reaches a Peak of Sixteen or Seventeen Percent Remember I Told You I Borrowed I Was Looking To Get a House and Get a Mortgage at Eighteen Percent That Was a 30-Year Fixed-Rate Back in the 1980s so Borrowing Rates Are Very Very Low by these Historical Standards if Borrowing Rates Are Very Low What Does that Tell You about Credit

But There Was a Period Back in 2000 Where this Yield Curve Was Actually Upward Sloping and Then Downward Sloping Why Would the Yield Curve Be Downward Sloping What that Tells You Is that There's an Expectation of the Market Participants that Interest Rates in the Long Run Have Got To Come Down and that There's Going To Be some Kind of Fed Policy Shift Possible within Three Years Five Years Ten Years That Would Make that More Likely than Not So by Looking at these Yield Curves over Different Dates You Can Get a Sense of How the Markets Expectations Are of the Future And So the Longer You Demand the Borrowing for a Greater Period of Time the More You Have To Pay Much More So than Just Linearly So in Particular the Expectation Hypothesis That Suggests that the Yield Curve Is Flat Right It Doesn't There's no There's no Impact on Borrowing for Two Years Three Years Five Years Ten Years the Future Rate Is Just Equal to Today's the Today's Forward Rate Is the Expectation of the Future Okay It's a Fair Bet Liquidity Preference Says that the Yield Curve Should Be Upward Sloping because It's Going To Be More Costly

Which by the Way Is a Wonderful Opportunity for all of You because if You Have a Model That Does Work Then You Can Do Extraordinarily Well You Can Turn Very Very Small Forecast Power into Enormous Amounts of Wealth Very Very Quickly on Wall Street Yes Does He You Can't Patent It Right So Does He Gain Anything out of that besides besides Notoriety Well that's a Good Question the Question Has To Do with I Guess the Difference between Academic Endeavors and Business Endeavors as an Academic What You're Trying To Do Is To Make a Name for Yourself and To Put Out Research Ideas That Will Have an Impact on with Your Colleagues

So Obviously We Know It's Not Easy To Do that and if It's Not Easy To Do that That Means that Our Assumption that the Bond Was Greater than the Cost of the Strip's Can't Be True if You Reverse the Logic You Get the Same Kind of Argument in Reverse Therefore the Only Thing That Could Be Is that the Prices Are Equal to each Other Next Time What We're Going To Do Is Show that a Little Bit of Linear Algebra Is Going To Allow You To Make Tons of Money by Comparing all Sorts of Bonds and

Looking at these Kind of Relationships

Intro

HYPOTHETICAL PERFORMANCE RESULTS HAVE MANY INHERENT LIMITATIONS, SOME OF WHICH ARE DESCRIBED BELOW. NO REPRESENTATION IS BEING MADE THAT ANY ACCOUNT WILL OR IS LIKELY TO ACHIEVE PROFITS OR LOSSES SIMILAR TO THOSE SHOWN. IN FACT, THERE ARE FREQUENTLY SHARP DIFFERENCES BETWEEN HYPOTHETICAL PERFORMANCE RESULTS AND THE ACTUAL RESULTS SUBSEQUENTLY ACHIEVED BY ANY PARTICULAR TRADING PROGRAM.

FOR EXAMPLE, THE ABILITY TO WITHSTAND LOSSES OR TO ADHERE TO A PARTICULAR TRADING PROGRAM IN SPITE OF TRADING LOSSES ARE MATERIAL POINTS WHICH CAN ALSO ADVERSELY AFFECT ACTUAL TRADING RESULTS. THERE ARE NUMEROUS OTHER FACTORS RELATED TO THE MARKETS IN GENERAL OR TO THE IMPLEMENTATION OF ANY SPECIFIC TRADING PROGRAM WHICH CANNOT BE FULLY ACCOUNTED FOR IN THE PREPARATION OF HYPOTHETICAL PERFORMANCE RESULTS AND ALL OF WHICH CAN ADVERSELY AFFECT ACTUAL TRADING RESULTS.

Their durations (a measure of interest-rate sensitivity) typically range between 75% and 125% of the three-year average of the effective duration of the Morningstar Core Bond Index.
