Neurologic Disease in Women

Although there appears to be a general understanding that the human brain functions similarly in women and in men, an increasing body of knowledge indicates that neuronal connectivity, recruitment, and disease patterns exhibit gender differences. There are clear gender differences in genetic expression, physiologic function, metabolism, hormonal makeup, and psychosocial profile, which often modify the clinical expression of neurologic and other diseases. In addition, ethnic, cultural, and economic factors are frequently overlooked in dealing with health problems of women, even though they undoubtedly have a strong influence on the clinical course of the illness. The second edition of *Neurologic Disease in Women*, the only text to specifically cover this important topic, will help physicians and other medical personnel seeking information relevant to clinical care. Sections address general anatomic, hormonal, epidemiologic, and drug aspects of women's health; neurologic conditions that arise during childhood, pregnancy, adulthood, and old age in females; and particular neurologic conditions that present differently or predominantly in females. There have been important advances in several areas prompting new chapters, new approaches and additional information provided in chapters on hormonal effects in women and the use of HRT; the adverse effects of antiepileptic drugs on hormonal homeostasis, weight and bone health; and cardiovascular diseases in women. New chapters include ones on reproductive and metabolic disorders with AED use, and on movement disorders.

Functional Disorders of the Nervous System in Women

This comprehensive resource covers a range of women's health issues and their intersection with neurologic and psychiatric disease. Chapters feature high quality, integrated information based on leading-edge research on gender-specific care and are grouped by reproductive years, pregnancy and health, and aging. With contributions by international experts, this interdisciplinary book will serve as a useful reference and guide for MS specialists, general neurologists, obstetricians/gynecologists, physicians in training, family practice doctors, clinical nurse specialists in multiple sclerosis, and all other healthcare professionals involved in the care and treatment of women affected by MS.

Neurology and Psychiatry of Women

Born in Vienna in 1864, Bernard Hollander was a London-based psychiatrist. He is best known for being one of the main proponents of phrenology. This title, originally published in 1916, looks at 'the numerous nervous illnesses of women, in which the mental factor plays a large part, and which are known as functional disorders, as distinguished from organic diseases'. He looks at the role of psychotherapy as an emerging treatment for these disorders. There is also a companion volume which looks at the *Nervous Disorders of Men*.

Lectures on Diseases of the Nervous System

This is a unique guide for women dealing with the difficulties of multiple sclerosis. After she was diagnosed with Multiple Sclerosis in 1976, author Judith Lynn Nichols realized that people suffering from chronic illness fare better when they share experiences with people fighting the same disease. While researching MS on the Internet, she connected with a group of women fighting to live with MS. The group quickly became each woman's support network, and, in the daily emails compiled in this book, they offered each other wisdom and humor about everything this disorder affects: diagnosis, employment, spirituality, family reactions, sexuality, pain control, depression, and more.

Epilepsy requires careful management and monitoring through a woman's life. Epilepsy is a complex disease. The hormonal changes women experience, both day-to-day menstrual fluctuations and the longer waxes and wanings of a reproductive lifetime, make the management of epilepsy even more complicated. At some point, the well-being of a second person, a fetus, might also have to be taken into account. Epilepsy in Women provides a detailed guide to this challenge. The wide-ranging approach encompasses all aspects of a woman's life including: Social and psychological impacts The impact in reproductive life Contraception Pregnancy Fetal health and long term developmental outcomes Lactation Menopause Each practical chapter begins and ends with a case study that demonstrates the more general challenge. The authors develop themes to provide clinical guidance based on evidence and experience. Written and edited by an international cast of experts, Epilepsy in Women provides crucial tips and recommendations for neurologists and gynecologists who need to be aware of the subtle effects of epilepsy on woman's life.

LECTURES ON DISEASES OF THE NERVOUS SYSTEM

Ironically, the organ with the greatest reason to differ between the sexes, the brain, is often viewed as the most androgynous of all. Are there differences? Almost by convention, male animals are used in laboratory experiments in neuroscience. Even in clinical drug trials in humans, females are often excluded from the early phases of testing because

Epilepsy in Women

For a woman of reproductive age, any medical appointment is a pre-conception visit and an opportunity to address pre-existing conditions that affect pregnancy and the maternal-fetal dyad. However, many neurologic conditions are rarely seen in pregnancy, and limited experience and knowledge may prevent the team from developing a shared approach to these complex conditions during pregnancy. Neurologi-

cal Diseases and Pregnancy: A Coordinated Care Model for Best Management brings together experts across the disciplines of maternal fetal medicine, neurology, obstetrics, family planning, genetics, anesthesia, psychiatry, neurosurgery, and lactation to provide a multi-disciplinary, comprehensive, protocol-driven guide on best care for patients with neurologic disease before, during and after pregnancy. Each chapter provides a detailed care map on each unique disorder, and discusses the use of neurological medications during pregnancy and in lactation. Through this multi-disciplinary approach clinicians can navigate the complexities of preconception and pregnancy care, and help to optimize outcomes for the mother-infant dyad. Beyond pregnancy care, this volume further serves as a resource on best care for the life-course of women affected by neurologic disease including pre-pregnancy planning, genetic counseling, contraception, and sexuality in neurologic disease, as well as post-partum depression and menopausal neurologic changes.

Lectures on Diseases of the Nervous System, Especially in Women

Published in association with the Epilepsy Foundation of America, this handbook reviews the special problems faced by women with epilepsy.

Neurological Illness in Pregnancy

Excerpt from Lectures on Diseases of the Nervous System: Especially in Women The case to which I drew your attention at my last clinic is here again, a girl, rather wanting in the signs of sexual ripeness, although sixteen years old. You will recall the fact that she lost the use of the right arm because of having been alarmed. The scare brought on what every woman knows as an attack of hysterics - our ancestors called it the vapors. The girl cried and laughed by turns, and then had a slight fit, on coming out of which she could no longer lift her right arm, or rather she could lift it but a few inches. On finding this to be the case, she grew much concerned, and by and by could not lift it at all, the idea that it could not be raised helping, as is apt to be the case, to make the trouble worse. Lectures on Diseases of the Nervous System

Women and Epilepsy Edited by M.R. Trimble Reader in Behavioural Neurology, Department of Neurology. Institute of Neurology, Queen Square, and Consultant Physician in Psychological Medicine, The National Hospital for Neurology and Neurosurgery, Queen Square, London, UK The purpose of this book is to reveal some of the very special problems of women with epilepsy. This is a multidisciplinary subject—ranging from psychosocial issues to clinical management—which has not previously been covered in a single text. Contributors drawn from diverse areas each lend their own expertise and perspectives to the overall theme. The topics are presented authoritatively and in a thought-provoking manner, such that the book will be important reading not just to epileptologists but to all those who care for female patients with epilepsy. They include chapters on assessment of the quality of life in epilepsy, counselling techniques, epidemiology, developmental differences between the sexes, problems of adolescence, sex hormones and contraception, catamenial epilepsy, teratogenesis and congenital malformations.

Lectures on Diseases of the Nervous System

Timely diagnosis and management of neurological diseases during pregnancy poses major therapeutic challenges to neurologists and other non-neurologist health care providers. Pregnancy is a unique period in life associated with significant hormonal and other physiologic changes in female patients, which may trigger or alter the course of neurological and psychiatric disorders. In addition, many diagnostic procedures that can be performed in non-pregnant women are prohibited during pregnancy for safety reasons. Therapeutic decisions and management of a pregnant patient with neurological disorders heavily depends on the issue of the reasonable balance between the risks of no treatment versus active treatment for the mother and her fetus. This book provides a review of the latest findings in this field, giving the neurologist and non-neurologist the information they need to determine the best treatment. Neurological disorders covered include multiple sclerosis, stroke and epilepsy. Discusses how neurological disorders should be managed in a pregnant patient Includes contributions from leading authorities

Women Living with Multiple Sclerosis

Sleep disorders are very common among women during their lifespan, presenting in isolation or in combination with other illnesses particularly psychiatric and neurologic disorders. Pregnancy-related sleep disorders pose an interesting dilemma as this is a transient phase; these are associated with potential long-term effects on maternal and fetal health. Menopause and pre-menopausal stages lead to a significant change in sleep architecture, sometimes associated with insomnia with or without sleep related breathing disorder. Sleep architecture in men and women varies due to significant hormonal differences between the genders. However, sleep complaints are disproportionately higher among women. This book presents 20 clinical cases to understand the differences in presentation of symptoms and treatment options for various sleep disorders that are more commonly noted among women. These cases cover a spectrum of sleep related breathing disorders, sleep related movement disorders, hypersomnias, parasomnias, issues of sleep fragmentation leading to insomnia in association with hormonal changes and some unique cases encountered in our clinical practices. This compilation of interesting clinical cases presents trainees and experienced physicians with a useful guide to assist in their clinical practices and will stimulate further research and studies.

Controversies in Caring for Women with Epilepsy

There are unique challenges to the care of women with epilepsy, including the gender-specific influences that women may experience owing to their age, hormonal status, and co-morbidities. Pregnancy is also a very important time for many women with epilepsy. This textbook is a portable, essential guide to the practical management of women with epilepsy. Busy clinicians can access a wealth of information summarized in a succinct and easily accessible format. Experts from around the world have reviewed and synthesized the available data from studies in hormones in epilepsy, pregnancy registries, and many aspects of the care of women with epilepsy from adolescence, through pregnancy, to menopause. Of interest to all who care for women with epilepsy, including neurologists, internists, obstetricians, anesthetists, primary care practitioners, nurses, and lactation consultants.

Women and Epilepsy

Increasing attention is currently being directed to a variety of health disorders that are either unique to or more common among women than men. This volume adds sleep disorders to the list of those in which important gender differences have been neglected. *Sleep Disorders in Women: A Guide to Practical Management* - explores the reasons for gender bias in this area of research and provides a comprehensive and in-depth review of what is currently known and what still remains to be studied concerning this important topic. As several contributors to this volume indicate, numerous misconceptions exist due, not surprisingly, to a shortage of reliable data in the field. As an example, obstructive sleep apnea (OSA) is typically thought to be far more common in men than in women. However, as contributors to this volume carefully document, the prevalence of OSA in women varies considerably depending on the specific female population that is studied. It is low in premenopausal women, higher in postmenopausal women, particularly high in women with polycystic ovary syndrome, and of uncertain prevalence in pregnancy. This exemplifies the fact that as women move through varying hormonal environments including puberty, the menstrual cycle, use of oral contraceptives, pregnancy, the postpartum period, and menopause, their risk for a variety of sleep disorders varies considerably. As pointed out in Dr.

Neurological Disorders and Pregnancy

Mood and anxiety disorders in women represent an increasingly important area of research and treatment development. The authors take a broad biopsychosocial and developmental approach to the issues, beginning with anxiety disorders in adolescence and progressing through the life phases of women to menopause and old age. All the disorders are covered, from anxiety and borderline personality disorder to stress and late-life depression. Particular attention is paid to questions of vulnerability; epidemiological and clinical evidence showing gender differences in such disorders; aetiological explanations in terms of biological (including hormonal) as well as psychosocial parameters, and treatment implications.

Sex and Gender Differences in Neurological Disease

Neurology and Pregnancy provides a comprehensive multidisciplinary guide to best practices for research and practicing neurologists, as well as obstetricians and other specialists caring for women with an acute or chronic neurological disorder. The book encompasses preconception care, genetic counseling, pregnancy in patients with chronic neurological disorders, and acute pregnancy-related

neurological complications. Postpartum care and complications, including lactation concerns, are also addressed, as well as the long-term effects of pregnancy and its complications on maternal brain health. Vol 1 summarizes the complex neurophysiological changes in pregnancy from a basic and translational science perspective. This includes neuroimaging, principles of neuro-obstetric critical care, and ethical and medicolegal concerns, describes normal fetal cerebral development and summarizes the management of the most common prenatal neurological diagnoses. Vol 2 focuses on chronic neurological conditions in pregnancy such as epilepsy, migraine, and multiple sclerosis, as well as acute neurological disorders including preeclampsia/ eclampsia, ischemic and hemorrhagic stroke, and CNS infections. Each chapter introduction includes data on epidemiology, when applicable. In discussing management, comments of safety profiles of medications preconceptionally, during pregnancy and lactation are summarized. Each chapter includes 1-2 illustrative cases. Encompasses both chronic and acute neurological disorders in pregnancy Includes epilepsy, sleep disorders, MS, headaches, neuromuscular disorders Covers spinal injury and movement disorders Contains cerebrovascular diseases and brain tumors Examines stroke, hemorrhage, TBI, preeclampsia and more Supplies illustrative case study examples
