Experimental Slips and Human Error

Whereas most humans spend their time trying to get things right, psychologists are perversely dedicated to error. Errors are extensively used to investigate perception, memory, and performance; some clinicians study errors like tea leaves for clues to unconscious motives; and this volume presents the work of researchers who, in an excess of perversity, actually cause people to make predictable errors in speech and action. Some reasons for this oddity are clear. Errors seem to stand at the nexus of many deep-psychological questions. The very concept of error presupposes a goal or criterion by comparison to which an error is an error; and goals bring in the foundation issues of control, motivation, and volition (Baars, 1987, 1988; Wiener, 1961). Errors serve to measure the quality of performance in learning, in expert knowledge, and in brain damage and other dysfunctional states; and by surprising us, they often call attention to phenomena we might otherwise take for granted. Errors also seem to reveal the "natural joints" in perception, language, memory, and problem solving-revealing units that may otherwise be invisible (e. g. , MacKay, 1981; Miller, 1956; Newell & Simon, 1972; Treisman & Gelade, 1980).

Experimental Slips and Human Error

In contrast to traditional approaches of mainstream psycholinguists, the authors of *Communicating with One Another* approach spontaneous spoken discourse as a dynamic process, rich with structures, patterns, and rules other than conventional grammar and syntax. Daniel C. O'Connell and Sabine Kowal thoroughly critique mainstream psycholinguistics, proposing instead a shift in theoretical focus from experimentation to field observation, from monologue to dialogue, and from the written to the spoken. They invoke four theoretical principles: intersubjectivity, perspectivity, open-endedness, and verbal integrity. Their analyses of historical and original research raise significant questions about the relationship between spoken and written discourse, particularly with regard to transcription and punctuation. With emphasis on political discourse, media interviews, and dramatic performance, the authors review both familiar and unexplored characteristics of spontaneous spoken communication, including: (1) The speaker's use of prosody. (2) The functions of interjections. (3) What fillers do for a living. (4) Turn-taking: Smooth and otherwise. (5) Laughter, applause, and booing: from individual listener to collective audience. (6) Pauses, silence, and the art of listening. The paradigm shift proposed in *Communicating with One Another* will interest and provoke readers concerned about communicative language use – including psycholinguists, sociolinguists, and anthropological linguists.

Communicating with One Another

Vol. 2 translated and with an introduction by Jane E. Knox and Carol B. Stevens.

The Collected Works of L.S. Vygotsky

In this volume, readers are introduced to Vygotsky's argument for a theoretical and methodological approach to differentiate "higher" mental functions from the more basic brain processes that other theorists believed were at the center of the psychological apparatus. The famed Soviet psychologist's view of developmental issues as an intricately woven tapestry of functions includes analyses of: - the development of speech and written language - the mastering of attention and mnemonic skills -

self-control and the higher, more cultivated forms of behavior - the cultural age, personality, and world view of children.

The Collected Works of L. S. Vygotsky

In this text, the authors review the last twenty-five years of progress in research and theory on language and communication in the psychopathological context. They also identify promising avenues for future research. This text will benefit students taking courses in psycholinguistics.

The Psychopathology of Language and Cognition

This book is an introduction to Vygotsky and his theories of language and second language acquisition. Employing a dual framework of metatheory and metaphor, the author focuses on Vygotsky's cultural-historical perspective (contrasted with the sociocultural heritage more prevalent in the West) and its emphasis on history as change and thought as related to action. Included also is a comparison of Vygotskian and Chomskyan theories of language and grammar.

Vygotsky's Psychology-Philosophy

Psychological vulnerabilities and environment influences are the most powerful forces shaping the behavior and choices of students to use harmful substances. This book employs computer-assisted Associative Group Analysis technology of comparative imaging and cognitive mapping to identify these factors and offers new perspectives for more comprehensive risk assessments and effective prevention.

Psychoenvironmental Forces in Substance Abuse Prevention

The aim of *Language for those who have Nothing* is to think psychiatry through the writings of Mikhail Bakhtin. Using the concepts of Dialogism and Polyphony, the Carnival and the Chronotope, a novel means of navigating the clinical landscape is developed. Bakhtin offers language as a social phenomenon and one that is fully embodied. Utterances are shown to be alive and enfolded and their meanings realised in the context of given social dimensions. The organisation of this book corresponds with carnival practices of taking the high down to the low before replenishing its meaning anew. Thus early discussions of official language and the chronotope become exposed to descending levels of analysis and emphasis. Patients and practitioners are shown to occupy an entirely different spatio-temporal topography. These chronotopes have powerful borders and it is necessary to use the Carnival powers of cunning and deception in order to enter and to leave them. The book provides an overview of practitioners who have attempted such transgression and the author records his own unnerving experience as a pseudopatient. By exploring the context of psychiatry's unofficial voices: its terminology, jokes, parodies, and everyday narratives, the clinical landscape is shown to rely heavily on unofficial dialogues in order to safeguard an official identity.

Language for Those Who Have Nothing

This book fills a critical gap in the cross-cultural literature by illuminating the bilingual experience in both its social and clinical contexts. Rafael Javier makes a convincing, empirically founded case for what he terms the bilingual mind, with its own particular approach to cognition, memory, and emotional and social development. Using this framework, he provides answers to important questions about the way bilingualism affects cognition and development.

The Bilingual Mind

This work gives a thorough revision of history through a psychological approach to verbal interaction between listeners and speakers. This book offers a large amount of information on the psychology of language and on psycholinguistics, and focuses on a new direction for a psychology of verbal communication. Empirical research includes media interviews, public speeches, and dramatic performances.

Dialogical Genres

In this volume, distinguished neurologist Jason W. Brown extends the microgenetic theory of the mind by offering a new approach to the problem of time and free will. Brown bases his work on a unitary process model of brain and behavior. He examines the problem of subjective time and free will, the

experiential present, the nature of intentionality, and the creative properties of physical growth and mental process.

Time, Will, and Mental Process

The papers in this volume all examine the nature of spoken word production in aphasia, and how this can inform current theories of language processing. It comprises 7 papers by some of the foremost researchers in the field. The first paper in the volume is an introduction by the editor (Dr Lyndsey Nickels), which reviews the 'state of the art' of the cognitive neuropsychology of spoken word production both in terms of theory and methodology. The individual papers address a range of topical issues including the levels of processing in speech production (Lambon-Ralph, Moriarty, Sage et al.; Wilshire); the nature of the interaction between levels of processing (Goldrick & Rapp); and effects of different factors on naming (word class and context: Berndt, Burton, Haendiges & Mitchum; phonemic and orthographic cues: Best, Herbert, Hickin, Osborne & Howard); lexical stress: Howard & Smith). Taken together this volume provides the reader with an insight into the cutting edge of research in spoken word production.

Cognitive Neuropsychological Approaches to Spoken Word Production

Psycholinguistics is an interdisciplinary field, and hence relationships are at its heart. First and foremost is the relationship between its two parent disciplines, psychology and linguistics, a relationship which has changed and advanced over the half century of the field's independent existence. At the beginning of the 21st Century, psycholinguistics forms part of the rapidly developing enterprise known as cognitive neuroscience, in which the relationship between biology and behavior plays a central role. Psycholinguistics is about language in communication, so that the relationship between language production and comprehension has always been important, and as psycholinguistics is an experimental discipline, it is likewise essential to find the right relationship between model and experiment. This book focuses in turn on each of these four cornerstone relationships: Psychology and Linguistics, Biology and Behavior, Production and Comprehension, and Model and Experiment. The authors are from different disciplinary backgrounds, but share a commitment to clarify the ways that their research illuminates the essential nature of the psycholinguistic enterprise.

Twenty-First Century Psycholinguistics

Drawing on a wide variety of modern and classical sources and multiple disciplines, this book presents and hypothesizes about the relationship between human language and thought to brain specialization. The authors focus on aphasia-language disorder resulting from local brain damage and show that the clinical aspect represents not only loss of function of the damaged area, but also results from the interaction between damaged and intact areas of the brain.

Language, Thought, and the Brain

This book reports the results of an extensive study of slips of the tongue produced by foreign language (L2) learners at different levels of proficiency. Thus, it provides new data which can be used to test current monolingual models of speech production and to further the development of bilingual speech production models. Moreover, it offers a new approach to the study of second language acquisition. The book contains a detailed survey of the findings of L1 slip research, including studies of slips produced by child L1 learners. It systematically compares these findings to those of the current L2 study and relates them to recent monolingual and bilingual models of speech production and to several cognitive models of second language acquisition. Special features of the book are its emphasis on methodological problems and the inclusion of the complete L2 corpus of 2000 slips of the tongue. It is expected that the book will be of interest to researchers and advanced students in the areas of speech production and second language acquisition, and particularly to those who would like to test their own hypotheses using the L2 data.

Summary of the contents of the book. The book provides an overview of the key findings in L1 slip research. It relates L1 findings to monolingual speech production models. It gives a detailed survey of studies of slips produced by children. It presents an up-to-date review of bilingual speech production models. It discusses recent cognitive models of second language acquisition. It gives a detailed description of an extensive research project on slips of the tongue produced by Dutch learners of English. The L2 slip corpus is tape-recorded. It discusses methodological problems in L1 slip research. It systematically compares the L1 findings to those of the L2 slip project. It relates the

findings to monolingual and bilingual models of speech production and to cognitive models of second language acquisition. It makes the data available in the appendix.

Slips of the Tongue

A state-of-the-art review of neural network modelling in core areas of cognitive psychology including: memory and learning, language (written and spoken), cognitive development, cognitive control, attention and action.

Connectionist Models in Cognitive Psychology

Bringing the science of psychology to life! The 2nd Australasian edition of *Psychology and Life* emphasises the science of psychology, with a special focus on applying that science to students' everyday lives. As a result, the features of *Psychology and Life* support a central theme: psychology as a science, with a focus on applying that science to real life experiences. Australasian research, examples and statistics help make the theory even more relevant for today's students. *Psychology and Life 2e* provides a rigorous, research-centred survey of the discipline while offering students special features and learning aids that will make the science of psychology relevant, spark their interest and excite their imaginations.

Language

Sign language linguists show here that all questions relevant to the linguistic investigation of spoken languages can be asked about sign languages. Conversely, questions that sign language linguists consider - even if spoken language researchers have not asked them yet - should also be asked of spoken languages. The HSK handbook *Sign Language* aims to provide a concise and comprehensive overview of the state of the art in sign language linguistics. It includes 44 chapters, written by leading researchers in the field, that address issues in language typology, sign language grammar, psycholinguistics, neurolinguistics, sociolinguistics, and language documentation and transcription. Crucially, all topics are presented in a way that makes them accessible to linguists who are not familiar with sign language linguistics.

Sign Language

This text provides a detailed account of psychology. Most topics are dealt with in terms of theory, evidence, and evaluation. The book features key research studies, case studies, research activities, and personal reflections.

Semiotica

Review text: "Dem Sprechwissenschaftler, der mehr über die individuellen Akte der Sprachverwendung erfahren will, dürfte diese PL bald unverzichtbar sein." Henner Barthel in: *Sprechen* 2006.

Forthcoming Books

This handbook focuses on new theoretical challenges associated with process-oriented psycholinguistics. Speech acts are embedded in situations that may vary in a multitude of parameters. Speech production and comprehension necessarily have to be both robust and flexible. Flexibility includes that speakers vary in speed, articulation, choice of words and interaction style, depending on specific context conditions. There is need of theoretical approaches that do not exclusively stick to ideals such as grammaticality and coherence - which collapse when confronted with irregularities - but are robust enough to deal with irregularities and disruptions. The handbook describes different methods of analyzing or reconstructing variants and options of language use. The articles contain transcriptions of spontaneous speech as well as experimentally verified studies. The same holds for simulation techniques modelling partial processes and evaluating their efficiency. There are no restrictions with respect to theoretical starting points - modelling of speech acts by neuronal networks as well as

rule-based knowledge of representation are both covered in the book. The languages of publication are German and English.

The British National Bibliography

This volume presents new conceptual and experimental studies which investigate the connection between vagueness and rationality from various systematic directions, such as philosophy, linguistics, cognitive psychology, computing science, and economics. Vagueness in language use and cognition has traditionally been interpreted in epistemic or semantic terms. The standard view of vagueness specifically suggests that considerations of agency or rationality, broadly conceived, can be left out of the equation. Most recently, new literature on vagueness has been released which suggests that the standard view is inadequate and that considerations of rationality should factor into more comprehensive models of vagueness. The methodological approaches presented here are diverse, ranging from philosophical interpretations of rational credence for vagueness to adaptations of choice theory (dynamic choice theory, revealed preference models, social choice theory), probabilistic models of pragmatic reasoning (Bayesian pragmatics), evolutionary game theory, and conceptual space models of categorisation.

Psycholinguistics

An innovative proposal for understanding how mental organisms make decisions and control behavior. In this book, Whitman Richards offers a novel and provocative proposal for understanding decision making and human behavior. Building on Valentino Braitenberg's famous "vehicles," Richards describes a collection of mental organisms that he calls "daemons"—virtual correlates of neural modules. Daemons have favored choices and make decisions that control behaviors of the group to which they belong, with each daemon preferring a different outcome. Richards arranges these preferences in graphs, linking similar choices, which thus reinforce each other. "Anigrafs" refers to these two components—animals, or the mental organisms (agents or daemons), and the graphs that show similarity relations. Together these two components are the basis of a new cognitive architecture. In Richards's account, a collection of daemons compete for control of the cognitive system in which they reside; the challenge is to get the daemons to agree on one of many choices. Richards explores the results of group decisions, emphasizing the Condorcet voting procedure for aggregating preferences. A neural mechanism is proposed. Anigrafs presents a series of group decisions that incorporate simple and complex movements, as well as aspects of cognition and belief. Anigrafs concludes with a section on "metagrafs," which chart relationships between different anigraf models.

Psycholinguistik. Psycholinguistics

Language is one of our most precious and uniquely human capacities, so it is not surprising that research on its neural substrates has been advancing quite rapidly in recent years. Until now, however, there has not been a single introductory textbook that focuses specifically on this topic. Cognitive Neuroscience of Language fills that gap by providing an up-to-date, wide-ranging, and pedagogically practical survey of the most important developments in the field. It guides students through all of the major areas of investigation, beginning with fundamental aspects of brain structure and function, and then proceeding to cover aphasia syndromes, the perception and production of speech, the processing of language in written and signed modalities, the meanings of words, and the formulation and comprehension of complex expressions, including grammatically inflected words, complete sentences, and entire stories. Drawing heavily on prominent theoretical models, the core chapters illustrate how such frameworks are supported, and sometimes challenged, by experiments employing diverse brain mapping techniques. Although much of the content is inherently challenging and intended primarily for graduate or upper-level undergraduate students, it requires no previous knowledge of either neuroscience or linguistics, defining technical terms and explaining important principles from both disciplines along the way.

International Journal of Psychosomatics

The author argues that the process of incrementally constructing perceptual representations, solving the binding problem (determining which properties go together), and, more generally, grounding perceptual representations in experience arise from the nonconceptual capacity to pick out and keep track of a small number of sensory individuals. He proposes a mechanism in early vision that allows us to select a limited number of sensory objects, to reidentify each of them under certain conditions as the same individual seen before, and to keep track of their enduring individuality despite radical changes in their properties--all without the machinery of concepts, identity, and tenses. This mechanism, which he calls FINSTs (for "Fingers of Instantiation"), is responsible for our capacity to individuate and track several independently moving sensory objects--an ability that we exercise every waking minute, and one that can be understood as fundamental to the way we see and understand the world and to our sense of space.
