This third edition continues to innovate by providing students with an integrated and modern approach to the subject. The text emphasizes the modern tools of chemistry while incorporating historical evidence, and its unique molecular/quantitative emphasis is further reinforced by an integrated media package developed by the authors. Also of benefit is the just-in-time presentation of key content - only providing details once they are needed. While key topics and analytical techniques have been updated, there is now an additional, third chapter on chemical equilibrium. The authors have also developed an expanded and more integrated problem-solving emphasis that now incorporates a 4-step strategy throughout, complete with text icons. The whole is backed by a range of supplements, including a new illustration program, a tutorial CD, interactive learningware, an extensive Web CT component, an instructor's resource CD, and a solution CD.

5 Steps to a 5: AP Chemistry 2022 Elite Student Edition

For the first time in science education, the subject of multiple solution methods is explored in book form. While a multiple method teaching approach is utilized extensively in math education, there are very few journal articles and no texts written on this topic in science. Teaching multiple methods to science students in order to solve quantitative word problems is important for two reasons. First it challenges the practice by teachers that one specific method should be used when solving problems. Secondly, it calls into question the belief that multiple methods would confuse students and retard their learning. Using a case study approach and informed by research conducted by the author, this book claims that providing students with a choice of methods as well as requiring additional methods as a way to validate results can be beneficial to student learning. A close reading of the literature reveals that time spent on elucidating concepts rather than on algorithmic methodologies is a critical issue when trying to have students solve problems with understanding. It is argued that conceptual understanding can be enhanced through the use of multiple methods in an environment where students can compare, evaluate, and verbally discuss competing methodologies through the facilitation of the instructor. This book focuses on two very useful methods: proportional reasoning (PR) and dimensional analysis (DA). These two methods are important because they can be used to solve a large number of problems in all of the four academic sciences (biology, chemistry, physics, and earth science). This book concludes with a plan to integrate DA and PR into the academic science curriculum starting in late elementary school through to the introductory college level. A challenge is presented to teachers as well as to textbook writers who rely on the single-method paradigm to consider an alternative way to teach scientific problem solving.
