Introduction

Review of oral cavity anatomy. The oral cavity includes the lips, teeth, hard and soft palate, gingiva, retromolar trigone, the buccal mucosa, and anterior 2/3 of the tongue.

Retromolar trigone. The retromolar trigone is a common crossroads where a lot of pathology occurs and it can cause referred ear pain. Mandibular invasion can also occur with masses that occur in this location.

Oral cavity cancer staging. Tumor (T) staging is based on the size of the tumor and depth of invasion. Nodal (N) staging is based on the number, location, and size of nodes, and metastasis (M) staging is based on the presence or absence of distant sites of disease.

Example case 1. This example case involves the oral tongue and measures 2-4 cm. It has ipsilateral lymph nodes less than 3 cm. This makes this a T2N2 tumor. Because metastases can't be evaluated with this information, it is given an 'X' for M staging right now.

Example case 2. This shows a subtle left tongue cancer measuring less than 2 cm. There are no lymph nodes. That makes this a T1N0Mx tumor.

Example case 3. This case is a hard palate tumor with bone erosion. The involvement through adjacent structures (the bone of the hard palate) makes this a T4 tumor. There is no nodal involvement, making this a T4N0Mx cancer.
