FISHER BODY GENERAL MOTORS AUTOMOBILE MANUFACTURE 44174 - FISHER BODY GENERAL MOTORS AUTOMOBILE MANUFACTURE 44174 by PeriscopeFilm 52,812 views 7 years ago 26 minutes - This film introduces its viewer to **Fisher Body**, Division of **General Motors**, and touts the use of computers in the development and ...

The pictures opens in a laboratory near Detroit, Michigan, as structural engineers are shown working at their computer screens and the narrator explains how their work is designed to test new automobile bodies. "What is remarkable is that these bodies have not yet been built," the narrator says at mark. "They are mathematical models in a computer, and scale models in plastic and metal built with the aid of computers." He continues at mark 01:06: "This use of computer design is the kind of innovative thinking necessary in the automotive industry today. The kind of thinking that traditionally has been the mark of the innovators of Fisher Body." With that, a high-tech display (by 1980s standards) of the film's title, "The Innovators," appears on a large computer monitor. The camera pans along rolls of steel, lines of aluminum, glass, and plastic, and yards of fabric and vinyl all being shaped and cut "to satisfy the personal mobility desires and needs of people in the United States and around the world."

The materials come from suppliers around the world, we are told at mark. to be joined together into a new automobile body. At mark , we see an animation of an cut-away car body, "the part of the car people ride in. The part they see and touch." While automobile bodies were once separate from the frame. With the gas shortage of the 1970s came a need for lighter cards that would consume less fuel. By the 1980s, we are told, General Motors was working on fulfilling that need, and we see footage of a project team discussing potential designs and then implementing them. "The end result is ... a full-sized model of each new GM automobile carefully sculpted in clay," the audience is told starting at mark .

But there is still work to do before the model becomes a full-fledged automobile, and the film takes us to scenes of precision tools measuring each inch of the model and that data fed into a computer so that a steel-and-aluminum body can be created. The relatively "new" idea of using aluminum, along with plastic and steel, is visited beginning at mark. as we see engineers evaluating such material, followed by scenes of veteran factory workers assembling car parts by hand, and the "sweetening" of the design by engineers sitting at computer terminals. Computers can also be used to program tools to work on the rough shaping of some parts, "leaving the fine detail work to his irreplaceable human touch."

A car model is next created in plastic, we learn at mark. at half the actual size, to learn about the structural performance of a vehicle. A half-scale steel model comes next. Although both versions are useful, they cannot totally replace the need for a full-size prototype body, we are told at mark . "Quality. Durability. And reliability. These are the goals of all this laboratory testing."

As comprehensive as laboratory testing are, the narrator explains near mark. that they still do not provide as much information as actual on-road handling, conducted at General Motors Proving Ground facilities in Michigan and Arizona. A number of scenes shows the viewer the carefully controlled test procedures as we see vehicles zig in and out around orange cones and across twisting roads. Two years after the first clay model was made, the latest GM model is ready for production. Mark shows us the various production processes, as the narrator explains that as many as 115 different models may be made in a single year. From the cutting of fabric to the welding of seams, the narrator explains that quality is always upmost importance.

Come mark. the viewer is told: "The body that began as designer's clay has emerged in hard steel." Pontiac GM Fisher Body 1970 Part 2 - Pontiac GM Fisher Body 1970 Part 2 by Leif Eriksson 53,449
