Advanced Designs to improve the Performance of Special Trackwork

Methods to Improve Special Trackwork Performance Background: Switches are a leading cause of accidents Top five switch related accident causes Gapped or chipped switch

+ Evaluation of designs and design elements which will minimize maximum lateral forces and life cycle costs Entry angle: significant effect •Pseudo-tangential alignments will provide significant benefit without

Key Findings: Switch Point Wear fField survey •Common height for chipped out points-indicates stock rail

NEW SWITCH POINT PROFILE DESIGN AND TESTING Findings - Point profiles play significant role in formation of rolling contact fatigue (RCF) - Point wear concentrated at the gage

Key Findings: Initial performance of Prototype Switch Point Profiles looks promising

Key Findings: Switch Point Service Life Extension

FAST Test of prototype f Helps vehicles steer away from switch point tips by varying track gage

Complications: • Wheelsets are oscillating laterally, depending on profile and truck design

Continuous Mainline Rail Turnout •Vertical switch

Conventional Split Switch (1 point and 1 stock rail on each route)

2012 BNSF Prototype built by Progress Rail Services (both points on the diverging route)

+ Key findings: •Track strength testing at FAST revealed a weak spot

Objectives: Test prototype turnout foundations to reduce stiffness changes •Proof of concept test

•FAST test plans for 2013
