How Humans Are Almost Identical to Chimps, According to DNA - How Humans Are Almost Identical

to Chimps, According to DNA by SciShow 580,387 views 2 years ago 11 minutes, 24 seconds - On

the genetic level, we're not all that different from chimps. But those small differences in DNA can have

massive effects.

To find the basic differences in the actual molecules that make up our DNA, we first needed to

sequence the full genomes of both humans and chimps.

Every gene is surrounded by shorter stretches of DNA that work like switches.

They control when and where in the body a gene is switched on, and how much protein is made from it.

This is all coordinated through a network of proteins and other molecules that interact with these switches.

And finding meaningful changes among all the neutral ones is like searching for a needle in a haystack

Modern humans have unique methylation patterns around hundreds of genes.

And it appears to enhance the activity of another gene specifically in the neocortex, an area involved in higher brain functions.

They should be able to use gene editing to see what happens to cells or organoids when you change individual DNA sequences.
